PART 1: Review Comments

	Reviewer's comment	Author's comment (if agreed with reviewer, correct the manuscript and highlight that part in the manuscript. It is mandatory that authors should write his/her feedback here)
Compulsory REVISION comments		
Minor REVISION comments	Methodology: The extraction method deserves to be better specified: How do you proceed to rid the extract of ethanol or methanol. Because both solvents are known to have an effect on the pathogen. Results: The values in the analysis should be expressed as mean \pm standard deviation. What explanation do the authors give to this finding "the lowest sporulation levels were observed in the highest concentrations of extract"?	We agree with some suggestions and added some the answers to the questions.
Optional/General comments	I am very happy for evaluating study regarding health. Authors obtained valuable results that the search for alternatives for the control of post-harvest diseases. Manuscript is well-designed, well-equipped with information, fluent and deducible. Calculations are true and very interesting. Figures and References are enough for this study.
