

Fumonisins are the group of mycotoxins generated usually by the *Fusarium spp*. in foods and feeds. However more than 15 isomers of fumonisin have been recognized, but the B series of fumonisins are the main and referral isomers of fumonisins. Fumonisin B can cause, leukoencephalomalacia in rabbits and horses and porcine pulmonary edema in swine. Also, fumonisin B is nephrotoxic, hepatotoxic, immunotoxic and carcinogenic. Fumonisin B blocks sphingolipid biosynthesis (hence, hinder the synthesis of ceramide) by a noticeable resemblance to sphingosine and sphinganine. This paper gives a review of the toxicity, occurrence, and mechanism of carcinogenicity, hepatotoxicity, nephrotoxicity, and immunotoxicity of fumonisins. Fumonisins are mainly found on several foods and feed in Africa, America, Europe, Asia, and Oceania. In this paper, we talk about current information on the worldwide contamination of feeds and foods by fumonisins. Because of economic losses induced by fumonisins and their hurtful effect on animal and human health, the various procedure for detoxifying infected feeds and foods have been illustrated in this review, containing; biological, physical, and chemical processes. Besides in this paper, we discuss dietary intakes and maximum limits of fumonisins in some countries.

8 *Keywords: Fumonisins; Toxicity; Detoxification; Mechanism; Occurrence; Intake*

## 11 **1. INTRODUCTION**

13 Fumonisins are a group of further than 10 mycotoxins created by *Fusarium* species like*; F. globosum,*  14 *F. oxysporum, F. proliferatum, F. verticillioides* and other species of *Fusarium, Alternaria alternata f.*  15 *sp. lycopersici,* and *Aspergillus niger* [1, 2].

16 Fumonisins have a noncyclic structure (opposite of most mycotoxins). In this structure, there is a 17 chain with 19- or 20- carbon aminopolyhydroxyalkyl that by tricarballylic acid groups (propane-1,2,3- 18 tricarboxylic acid) was diesterified Fig. 1. Hitherto, various chemically associated series or groups of 19 fumonisins have been isolated. These series are consist of A, B, C, and P. The main detected forms<br>20 of fumonisins in foods, are the B series of fumonisins [3]. Fumonisins B, fumonisins B, and 20 of fumonisins in foods, are the B series of fumonisins [3]. Fumonisins  $B_1$ , fumonisins  $B_2$ , and <br>21 fumonisins  $B_3$  are the broadest mycotoxins between the more than 15 fumonisin forms that have been 21 fumonisins  $B_3$  are the broadest mycotoxins between the more than 15 fumonisin forms that have been<br>22 described until now [4]. described until now [4].

#### 25 **Fig. 1. Chemical structures of the fumonisins. From: [1, 2]**

26 27 Fungi-producing fumonisin contaminated apple, barley, beef, breakfast cereals, black tea, corn, 28 cornbread, corn flour, corn flakes, corn grits, corn snacks, basmati rice, crunchy nut, egg, milk, oats, 29 polenta, popcorn, row corn, soybean, canned foods, tomato, tortilla, and wheat [5]. polenta, popcorn, row corn, soybean, canned foods, tomato, tortilla, and wheat [5].

 Intake of fumonisin B induced a different of toxic effect in animals, containing leukoencephalomalacia in horses [6], change in weight of body and internal organ in broiler chicken [7, 8], pulmonary edema and hepatocellular necrosis in piglet [9, 10]. Moreover, renal and hepatic toxicity has been detected in different animal, containing rabbits, lambs, turkeys, mice, rats, and broilers [7, 11-14].

34 In human, fumonisins were increased risk of neural tube defects (NTD) and developing esophageal cancer [15, 16]. 36

## 37 **2. TOXICITY OF FUMONISINS**

39 In the human and different animal, fumonisins beget some toxic effects such as carcinogenic, 40 hepatotoxic, and nephrotoxic. Moreover, sensitivity to fumonisins is different in human and varies 41 animal for example; based on [17] saying, rats are more sensitive to fumonisin  $B_1$  than mice. We 41 animal for example; based on [17] saying, rats are more sensitive to fumonisin  $B_1$  than mice. We <br>42 summarized in Table 1 disorder effects. dosage. duration and source of fumonisin. summarized in Table 1 disorder effects, dosage, duration and source of fumonisin.

## 47 **2.1 Carcinogenicity**

48 Stockmann [16] reported that the  $FB_1$  and  $FB_2$  in wheat and corn increased the risk of esophageal<br>49 cancer in many countries. Also, there is a significant correlation between esophageal cancer and cancer in many countries. Also, there is a significant correlation between esophageal cancer and 50 contaminated rice with  $FB_1$ , in Iran [18]. [19] declare that, high concentration rates of  $FB_1$  has a 51 feasible contributive role in human esophageal carcinogenesis and hepatic carcinogenesis. feasible contributive role in human esophageal carcinogenesis and hepatic carcinogenesis.

52 Fumonisin B can stimulate the proliferation of human esophageal epithelial cells (HEECs) [20], the 53 proliferation of bile ductular cells and hepatocyte proliferation in cattle [21].

54 In rats, continuing (up to 2 years) intake of  $FB_1$  consequenced the introduction of renal tubule tumors,<br>55 hepatocellular adenomas, cholangiocarcinomas, and carcinomas [22, 23]. hepatocellular adenomas, cholangiocarcinomas, and carcinomas [22, 23].

#### 56 57 **2.2 Hepatotoxic Effect**

58 [11] by performing histological examination demonstrated that the fumonisins can create a mild 59 hepatopathy in lambs.

 Fumonisin effects in the research of [24] on calves were significant. According to their study, increases in gamma-glutamyl transpeptidase (GGT), lactate dehydrogenase (LDH), serum aspartate aminotransferase (AST), cholesterol and bilirubin, and mild microscopic liver lesions in two calves were existd. In [21] observation, hepatic lesions were distinguished by the different severity of disorganized hepatic cords and hepatocyte apoptosis.

65 In broiler chicken increasing dietary fumonisin  $B_1$  caused the increase in liver weights, serum calcium, 66 cholesterol, and AST levels. In addition, biliary hyperplasia and multifocal hepatic necrosis were 66 cholesterol, and AST levels. In addition, biliary hyperplasia and multifocal hepatic necrosis were 67 present in these chickens [8]. In researches of [7, 25], chickens fed with fumonisin B<sub>1</sub>, sphinganine:<br>68 sphingosine (Sa: So) ratio, serum glutamate oxaloacetate aminotransaminase (SGOT), levels of free sphingosine (Sa: So) ratio, serum glutamate oxaloacetate aminotransaminase (SGOT), levels of free 69 sphinganine in the serum, AST ratios, LDH, and GGT were increased. Nonetheless, total liver lipids of

- $70$  chicks were decreased significantly. [26] demonstrated that subacute treatment of broiler chicks to<br>71 fumonisin B<sub>1</sub> bring about hepatic oxidative stress simultaneously with SA/SO gathering. Also, TBARS 71 fumonisin  $B_1$  bring about hepatic oxidative stress simultaneously with SA/SO gathering. Also, TBARS 72 (Thiobarbituric acid reactive substance) levels, catalase activity, and Vit C content were increased.
- 72 (Thiobarbituric acid reactive substance) levels, catalase activity, and Vit C content were increased.
- 73 Feeding the turkey with fumonisin  $B_1$  caused increases in liver weights and serum AST levels.<br>74 However, serum cholesterol, alkaline phosphatase, MCH (mean cell hemoglobin) and MCV (mean
- However, serum cholesterol, alkaline phosphatase, MCH (mean cell hemoglobin) and MCV (mean 75 cell volume) were declined. Also, hypertrophy of Kupffer's cells and biliary hyperplasia were present in 76 these turkeys [13].
- 77 Because of  $FB<sub>1</sub>$  in the plasma, cholesterol, total protein, alanine aminotransferase (ALT), LDH, GGT
- 78 and SA/SO (sphinganine to sphingosine ratio) were risen. Liver weight growth with liver hyperplasia 79 was existed in ducks [27].
- 80 [28] declared that hepatic effects of  $FB_1$  in mice were increased in liver enzymes like AST and ALT in 81 circulation. In addition, [17, 29] demonstrated that serum levels of the whole bile acids, alkaline
- circulation. In addition, [17, 29] demonstrated that serum levels of the whole bile acids, alkaline
- 82 phosphatase, and cholesterol, were risen and hepatocellular hypertrophy, hepatocellular apoptosis,
- Kupffer cell hyperplasia, hepatocellular single cell necrosis, mitosis, anisokaryosis, and macrophage 84 pigmentation were detected in the mice that fed with  $FB<sub>1</sub>$ .
- 85  $FB<sub>1</sub>$  in rabbits can cause a significant increase in alkaline phosphatase (AP), total protein, AST, ALT,
- and GGT. Also, degeneration of hepatocytes and apoptosis were the prominent degenerative changes in liver of rabbits [14, 30].
- 
- 88 Because of fumonisin  $B_1$ ,  $B_2$ , and  $B_3$ , a hepatic necrosis in ponies occurred [31].<br>89 Effect of fumonisins in the liver of piglet was apoptosis, necrosis, hepatocyte pro 89 Effect of fumonisins in the liver of piglet was apoptosis, necrosis, hepatocyte proliferation, hyperplastic<br>80 hepatic nodules (in chronic studies), icterus, and hepatocellular necrosis. Besides serum cholesterol.
- hepatic nodules (in chronic studies), icterus, and hepatocellular necrosis. Besides serum cholesterol,
- 91 alkaline phosphatase, AST activities and sphinganine and sphingosine concentrations in kidney,<br>92 beart, lung, and liver were elevated. But there were no detectable portal triads or central veins. heart, lung, and liver were elevated. But there were no detectable portal triads or central veins,
- adjacent parenchyma, and the perilobular connective tissue was compressed [10, 32-34]
- 

## **2.3 Kidney Toxicity**

- Fumonisin in the kidney of lambs revealed with tubular nephrosis [11].
- 97 Accumulation of sphingosine and sphinganine in the kidney of calves created renal lesion like<br>98 vacuolar change karvomegaly apoptosis dilatation of proximal renal tubules (that included protein 98 vacuolar change, karyomegaly, apoptosis, dilatation of proximal renal tubules (that included protein 99 and cellular debris) and the proliferation of proximal renal tubular cells [21]. and cellular debris) and the proliferation of proximal renal tubular cells [21].
- Effect of fumonisin in the kidney of turkeys and broiler chicken was increasing in kidney weight [7, 13, 35].
- In both sexes of rats, fumonisins were decreased kidney weight, also nephrosis in outer medulla of rats (especially in female rats) was observed [12].
- [14, 30] reported that the effect of fumonisin in the kidney of the rabbit was apoptosis and degeneration of renal tubule epithelium, also level of urea and creatinine was increased.
- 106 Fumonisins in the kidney of pigs create a mild degenerative change and in the urine of pigs the 107 highest Sa/So ratio and Sa ratio were produced in the  $48<sup>th</sup>$  h [9, 33]. highest Sa/So ratio and Sa ratio were produced in the  $48<sup>th</sup>$  h [9, 33].
- 

## **2.4 Leukoencephalomalacia**

- 110 [36] reported that fumonisins (especially fumonisin  $B_1$ ) are the causal factor in the development of 111 LEM in horses. The lethality rates, mortality, and morbidity in horses were 85.7%, 10%, and 11.6% LEM in horses. The lethality rates, mortality, and morbidity in horses were 85.7%, 10%, and 11.6% respectively [6].
- Nervous signs that were emerged by fumonisin in horses, consisted mainly of ; apathy, incoordination,
- walking into objects, changes in temperament, just in one horse paralysis of the tongue and lips,
- paresis of tongue and the lower lip, inability to drink or eat, a wide-based stance, reluctance to move,
- trembling, hyperexcitability, four leg ataxia, blindness, tetanic convulsion, aimless walking and circling developed by death [6, 36, 37].
- In horses with LEM because of fumonisins, the brain lesions were observed such as; severe to early
- bilaterally symmetrical edema of the brain, brown-yellow discoloration, focal necrosis in the medulla oblongata, focal or multifocal areas of hemorrhage, sporadically pyknotic nucleus all over the areas of
- rarefaction hemorrhage, softening of the sub-cortical white matter, cavitations crowded with
- proteinaceous edema with rarefaction of the white matter, mild percolation by infrequent eosinophils
- and neutrophils, intracytoplasmic eosinophilic globules, inflamed glial cells with plentiful eosinophilic cytoplasm, inflamed glial cells with plentiful eosinophilic cytoplasm, cell edges were seprated,
- hyperchromatic, edema, necrosis, wide parts of malacia in the white matter of the cerebral hemispheres, cerebellum, and brainstem [6, 36, 37].
- Fumonisin created leukoencephalomalacia in rabbits and the bilateral brain microscopic lesions consisted of focal small bleeding in the malacia, cerebral white matter, and bleeding in the hippocampus [30].

## **2.5 Porcine Pulmonary Edema (PPE)**

- Usual damages in Fumonisin B-fed pigs were severe edema in the lung by inhibiting sphingolipid biosynthesis and phagocytosis in pulmonary macrophages and gathering of substance material in pulmonary capillary endothelial cells [9, 32].
- The clinical sign in pigs because of pulmonary edema (induced by fumonisins) consisted of;
- hydrothorax and respiratory distress (reveal by getting up respiratory rate and effort with open mouth
- and abdominal breathing). Lethal pulmonary edema appears during 4 to 7 days after the daily feed or 138 intravenous treatment of  $FB<sub>1</sub>[10, 32]$ .
- 
- **2.6 Other Toxic Effects**
- 141 Exposure to  $FB_1$  during the first trimester and before the pregnancy emerged to get up the hazard of  $142$  neural tube defects (NTD; by reason of defect of the neural tube to close, embryonic defects of the neural tube defects (NTD; by reason of defeat of the neural tube to close, embryonic defects of the
- spinal cord and brain happened) [15, 38].
- Diarrhea and lethargy were detected in fumonisin administrated lambs [11].
- Feeding by fumonisin in calves has some effects such as; impairing the lymphocyte blastogenesis
- [24], lethargy, increasing of sphingosine and sphinganine concentrations in the heart, lung, and
- 147 skeletal muscle. Elevate in the concentration of sphinganine, but not sphingosine, in brains of 148 managed calves [21]. managed calves [21].
- 149 In broiler chicks,  $\overline{FB}_1$  had a bad effect on weight, water consumption, feed efficiency, and body [35].<br>150 Although body weight was decreased, the weight of bursa of Fabricius, gizzard, and proventriculus Although body weight was decreased, the weight of bursa of Fabricius, gizzard, and proventriculus
- 
- 151 was increased. Other effects of  $FB_1$  consisted of diarrhea, thymic cortical atrophy, and rickets [8, 35].<br>152 Fumonisin B<sub>1</sub> in turkey appeared thymic cortical atrophy, and moderate enlarging of the proliferating Fumonisin  $B_1$  in turkey appeared thymic cortical atrophy, and moderate enlarging of the proliferating
- and degenerating hypertrophied zones of tibial physis [13].
- [39] reported that fumonisin in the egg can cause extreme haemorrhages of the thoracic area, head, neck of the dead embryos.
- In mice, fumonisins can cause adrenal cortical cell vacuolation and may cause increases in serum cholesterol. Vacuolated lymphocytes and myeloid cells were also detected in mice due to fumonisins
- [17].
- Fumonisins in pigs had some effects such as; decrease in left ventricular dP/dT (max) (an indicator of
- heart contractility). But mean pulmonary artery pressure, heart rate, mean systemic arterial pressure,
- cardiac output, and pulmonary artery wedge pressure by obstruction of L-type Ca channels by get up sphinganine and/or sphingosine mass, were increased. Also in studies, parakeratosis, postpone in the
- pattern of papillary of the distal esophageal mucosa (part of stratum basale), hyperkeratosis, and
- hyperplastic nodules in the liver cell, esophageal plaques, and right ventricular hypertrophy were
- detected [32, 34].
- 

## **3. METABOLISM AND MECHANISM OF FUMONISINS**

 Structure of fumonisin B has a noticeable similarity to sphinganine and sphingosine Fig. 2 both sphingosine and sphinganine are intermediates in the degradation and biosynthesis of sphingolipids. Furthermore, [40] reported that fumonisin B obstruct sphingolipid biosynthesis by specifically inhibiting

- sphingosine (sphinganine) N-acyltransferase, in vitro and in situ.
- 

#### 174 175 **Fig. 2. Structures of fumonisin B, sphingosine, sphinganine and ceramide backbone[1]; [3]** 176

177 Sphingolipids are a group of lipids that can be detected in the whole of eukaryotic cells. All of the 179 sphingolipids include a sphingoid (long-chain base backbone). Sphingolipids are urgent basic<br>180 molecules and rule as regulators of a numeral of cell act [41]. In Fig. 3 location of working of fumonisin 180 molecules and rule as regulators of a numeral of cell act [41]. In Fig. 3 location of working of fumonisin<br>181 B-induced inhibition of the enzyme CER synthase, is presented. B-induced inhibition of the enzyme CER synthase, is presented.

182

#### **Fig. 3. A summarized scheme of the sites of action of fumonisin B-induced inhibition of the enzyme ceramide synthase on the pathway of de novo sphingolipid synthesis and turnover in**

- **mammalian cells and [4].**
- 

#### **3.1 Mechanism of Fumonisins in Apoptosis and Cancer**

 Interruption of sphingolipid metabolism can cause the increase in available sphingoid backbone and their 1-phosphates, changing in compound sphingolipids, and decrease in the biosynthesis of ceramide (CER). Available sphingoid backbone induced cell death but fumonisin inhibition of CER synthase can restrain cell death influenced by ceramide [42].

193 Feedback of the apoptosis and carcinogenicity effects induced by fumonisin  $B_1$  can be some 194 mechanisms including oxidative damage, lipid peroxidation and maybe induction of hepatic, and renal mechanisms including oxidative damage, lipid peroxidation and maybe induction of hepatic, and renal 195 tumors can happen [16]. Also, [43] discovered that  $FB_1$  was able to promote the production of free 196 radicals (by increasing the rate of oxidation) and by lipid peroxidation in membranes can accelerate radicals (by increasing the rate of oxidation) and by lipid peroxidation in membranes can accelerate

chain reactions.

 Increasing in sphinganine of tissue by FB was able to elevate beginning a cascade of cellular changes that probably product the carcinogenicity and toxicity by an unknown mechanism(s). However, in the following of sphinganine-induced cell proliferation and apoptosis and cancer incidence might be elevated [3].

202 In some studies following fumonisin  $B_1$  treatment in different cells of human and animals, has been 203 shown that apoptosis caused by fumonisin  $B_1$  does not entail p53 or Bcl-2 group proteins and protect cells from the apoptosis by baculovirus gene (CpIAP). Baculovirus gene obstructs induced apoptosis by the tumor necrosis factor (TNF) pathway that caspase-8 was cleaved. The mitochondrial pathway 206 perhaps is consisted of induced apoptosis by fumonisin  $B_1$  by the actuation of Bid, release cytochrome

- c [16].
- 208 [20] reported that fumonisin  $B_1$  in human normal esophageal epithelial cells (HEECs) stimulated the 209 proliferation. Mechanism of the proliferation of the content as decreasing in protein expression of cyclin E.
- proliferation. Mechanism of the proliferation of HEECs is, decreasing in protein expression of cyclin E,
- p21, and p27 and increase in protein expression of cyclin D1.

 **Fig. 4. A schematic landscape of the pathways conduct to apoptosis and the mechanisms probably consisted of fumonisin B1 -induced activation of caspase-3 resulted in apoptosis. X mark showed the mechanisms that are not consisted of the apoptosis caused by fumonisin B1** 

 **[**4**].** 

## **3.2 Mechanism of Fumonisins in Hepatotoxicity**

218 Accumulation of sphingoid base because of induced fumonisin  $B_1$  can induce TNF-a and make the hepatotoxicity in mice. Also, TNF-α receptor 1b is urgant mediating in the hepatotoxic responses by a rise in the circulation of liver enzymes [28].

#### **3.3 Mechanism of Fumonisins in Immunotoxicity**

- 223 Exposure to FB<sub>1</sub> in human dendritic cells; getting up the exhibition of IFN-γ and the associated 224 chemokine CXCL9. Nevertheless, fumonisin B<sub>1</sub> may decline the lipopolysaccharide-induced liver and chemokine CXCL9. Nevertheless, fumonisin  $B_1$  may decline the lipopolysaccharide-induced liver and brain expression of IL-1β and IFN-γ in addition to the lipopolysaccharide -induced expression of IL-1β, IL-6, and the chemokines CCL3 and CCL5 in human dendritic cells [16].
- 227 In piglets, fumonisin B<sub>1</sub> exposure can increase expression of IL-18, IL-8, and IFN-γ mRNA. But mRNA<br>228 measure of TNF-α. IL-18 in piglet alveolar macrophages and levels of IL-4 may decrease [441: [45]. measure of TNF-α, IL-1β in piglet alveolar macrophages and levels of IL-4 may decrease [44]; [45].
- After exposure to fumonisin B<sub>1</sub> in mouse, a getup expression of TNF-α and interleukin-1β (IL-1β) has<br>230 been observed in kidney and the liver. Also, FB<sub>1</sub> can raise expression of IFN-v, IL-1α, IL-18, IL-12, IL-
- 230 been observed in kidney and the liver. Also,  $FB_1$  can raise expression of IFN-γ, IL-1α, IL-18, IL-12, IL-<br>231 10. and IL-6 in liver of mouse [16]. 10, and IL-6 in liver of mouse [16].
- 

## **3.4 Mechanism of Fumonisins in Some Disorder**

- 234 [46] recommended that the fumonisin  $B_1$ -induced destruction of cardiovascular action may be one of 235 the maior elements provide to the happening of equine leukoencephalomalacia by the get up in serum
- the major elements provide to the happening of equine leukoencephalomalacia by the get up in serum
- and sphingosine concentrations and myocardial sphinganine.

237 Interruption of sphingolipid metabolism resulted in  $FB_1$  before the pregnancy and during the first 238 trimester may affect folate uptake and cause by a development risk of NTD [47]; [48]. 238 trimester may affect folate uptake and cause by a development risk of NTD [47]; [48].

 $239$  FB<sub>1</sub> by the increase in sphingosine and/or sphinganine concentrations reduces the mechanical 240 potency of the left ventricle and blocks L-type Ca channels. Pulmonary edema could generally be 241 caused by acute left-sided heart failure [49]; [50].

242

#### 243

## 244 **4. DETOXIFICATION OF FUMONISINS**

 Strategies of detoxification for infected feeds and foods to diminish or remove the toxic effects of fumonisins by biological, physical, and chemical processes are essential to boost food safety, hinder financial damage, and recover infected commodities. Data detected on biodegradation, detoxification, and binding procedures of fumonisins are abridged in Table 2.

#### 249<br>250 250 **Table 2. Biodegradation, detoxification, and binding processes of fumonisins**

- 251 252
- 253

#### 254 255 **4.1 Biological Methods**

- 256 An enzymatic detoxification process is by recombinant enzymes from the bacterium *Sphingopyxis sp.* 257 resulted in hydrolysis of fumonisin  $B_1$  to HFB<sub>1</sub>; deamination of HFB<sub>1</sub> by aminotransferase (miss of the 258 two tricarballylic side-chains via carboxylesterase) in the existence of pyridoxal phosphate and two tricarballylic side-chains via carboxylesterase) in the existence of pyridoxal phosphate and 259 pyruvate. Lactic acid bacteria such as *Micrococcus luteus* and *Bacillus subtilis* bind to fumonisin B<sup>1</sup>  $260$  and fumonisin  $B_2$ , therefore detoxification is processed. Peptoglycan bind to leastwise one 261 tricarballylic acid part in the structure of  $FB<sub>1</sub>$  and especially  $FB<sub>2</sub>$  [2].
- 262 [51] removed 52.9% FB1 and 85.2% FB2 by two *Lactobacillus* strains (*L. pentosus X8* and *L.*  263 *plantarum B7*), in the aqueous medium.
- 264 [52] reported that fermentation using three different yeast strains (*Saccharomyces*) is a method for 265 detoxification of fumonisins, thus a maximal decrease was observed in 28% and 17% for fumonisin 266 B<sub>1</sub> and fumonisin  $B_2$ , respectively.
- 267 Hydrolyzing ester bonds of fumonisin B1 by black yeasts (*Exophiala spinifera* and *Rhinoclodiella*  268 *atrovirensa*) reported by [53].
- 269 [54] by means of *Candida parapsilosis* could inhibit mycelial growth of *Fusarium* species from 74.54%
- 270 and 56.36%, and the maximum and minimum decrease in whole created fumonisin was 78% and 271 12%, respectively. 272

## 273 **4.2 Physical and Chemical Methods**

- 274 Fumonisin B<sub>1</sub> needs a massive temperature (150–200 °C) to gain 87–100 % demolition in corn 275 cultivation [53]. cultivation [53].
- 276 [55] reported that because of the extrusion of dry-milled products, decreasing in the measure of 277 fumonisins was 20–50 % for non-mixing extruders and 30–90 % for mixing-type extruders. For the 278 production of cornflakes through the extrusion and roasting of raw corn, 60–70 % of fumonisins  $B_1$  and 279 B<sub>2</sub> were loosened. But removing of fumonisins only in the extrusion step was less than 30 % [56]. 279 B<sub>2</sub> were loosened. But removing of fumonisins only in the extrusion step was less than 30 % [56].<br>280 Destroving of fumonisin B<sub>1</sub> in extrusion processing of grits, was 92 % [56]. The economical, lowest
- Destroying of fumonisin  $B_1$  in extrusion processing of grits, was 92 % [56]. The economical, lowest 281 toxic and most biodegradable solvent for fumonisin extraction is ethanol-water [57].
- 282 [58] and [59] in their studies reported that in baking corn muffins, removing of fumonisin during baked 283 for 20 minutes were amidst 16 and 28 % at 175 °C and 200 °C respectively, also flotation the corn in 284 water reduced the amount of fumonisin  $B<sub>1</sub>$ , and frying corn chips for 15 minutes at 190 °C bring about 285 a remove of 67 % of the fumonisin. But spiked corn masa fried at  $140-170$  °C (while degradation 286 begin to take placed above 180 °C) has no significant loss of fumonisin  $B_1$ .
- 287 One of the most impressive management to decline the measure of fumonisin B1 is a 0.2 % solution 288 of  $SO_2$  at 60 °C for six hours [60]. But canning and cooking had a small influence on fumonisin 289 measure [61]. measure [61].
- 290 In [62] studies, the adsorption capacity of cholestyramine for fumonisin  $B_1$ ; 85% from a solution 291 including 200  $\mu$ g/ml FB<sub>1</sub>, were reported.
- 292 Detoxification of corn with ammonia process reduced fumonisin levels (30 to 45 %) and no mutagenic 293 potentials were obvious in the managed corn [63].
- 294 Obstruction the amine group of fumonisin B1 by reaction with fructose is another way to the 295 detoxification of fumonisin  $B_1$  [64].<br>296 The percentage of reduction of F
- 296 The percentage of reduction of  $FB_1$  in corn by single Ca(OH)<sub>2</sub> (nixtamalization) or with Na-HCO<sub>3</sub> + 297 H<sub>2</sub>O<sub>2</sub> (modified nixtamalization), was 100% [65]. 297  $H_2O_2$  (modified nixtamalization), was 100% [65].<br>298 Chlorophorin gets from vanillic acid, ferulic acid
- 298 Chlorophorin gets from vanillic acid, ferulic acid, caffeic acid, and iroko decreased FB<sub>1</sub> levels by 90–<br>299 91% [66]. 299 91% [66].
- 300 Treatment with oxidizing agents is an economical method for detoxification of fumonisin  $B_1$ , but this 301 method isn't demonstrated in bioassays [65].
- 302 The acidic aqueous solution such as  $NaNO<sub>2</sub>$  can create deamination in fumonisin B<sub>1</sub>, significantly [67].<br>303 In the floating section after treatment with NaCl solution. 86% of FB<sub>1</sub> were removed [68].
- 303 In the floating section after treatment with NaCl solution, 86% of  $FB_1$  were removed [68].<br>304 Celite and O3 couldn't make a significant difference in the level of  $FB_1$ , but bentonite a
- 304 Celite and O3 couldn't make a significant difference in the level of  $FB_1$ , but bentonite adsorbed only 305 12% of the  $FB_1$  [62, 69]. 12% of the FB<sub>1</sub> [62, 69].

## 308 **5. OCCURRENCE**

 According to [70] by means of increases in global grain exchange, probably fungi spread from one country to another. In *Fusarium* fungi, this hazard expected to be minimum whereas these phytopathogens are field sooner than storage organisms. The global infection of animal feeds and foodstuffs with fumonisins is described in Table 3.

313

## 314 **Table 3. Occurrence of fumonisins from human foods, cereals, and crops in various countries.**

316 **5.1 North and South America**

- 317 In the USA, the infection of corn by fumonisins was detected by [71] and [72]
- 318 [73] declared that the infection of corn with fumonisin  $B_1$  in Honduras was 0.068 to 6.5 mg/kg.
- 319 In Brazil, the incidence of fumonisins was detected in corn by [74], [75], [76], [77], [78] and [79]. The 320 infection of wheat, oat and barely by fumonisins was also detected by [78].
- 321 In Uruguay, a research for checking measure of fumonisins in corn commodities showed the 322 contamination of corn with fumonisin  $B_1$  was 0.165 to 3.688 mg/kg [80].<br>323 [81] reported that the infection of corn with fumonisin B1 in Venezuela w
- [81] reported that the infection of corn with fumonisin B1 in Venezuela was 25 to 15050 ng/g.
- 324 The average of fumonisins in corn of Argentina was 10200 µg/kg in 2003 and 4700 µg/kg in 2004 [82]. 325

## 326 **5.2 Asia and Oceania**

- 327 In China, the contamination of corn with fumonisins was reported by [83]; [84], [85], [71], [86] and [87].
- 328 Based on these studies the most extreme concentration of fumonisin  $B_1$ ,  $B_2$  and  $B_3$  were 25.97 mg/kg,
- 329 6.77 mg/kg and 4.13 mg/kg respectively. Also, [88] reported that in China total fumonisins 330 concentration was 0.5 to 16 mg/kg.
- 331 The contamination of corn with fumonisin  $B_1$  and  $B_2$  was detected by [89] in Japan.<br>332 In Iran [90] investigated infection of corn with fumonisin  $B_1$ ,  $B_2$ , and  $B_3$ . Also, [18]
- 332 In Iran [90] investigated infection of corn with fumonisin  $B_1$ ,  $B_2$ , and  $B_3$ . Also, [18] reported the corn's 333 contamination with fumonisin  $B_1$ . 333 contamination with fumonisin  $B_1$ .<br>334 [91] declared that the measure o
- [91] declared that the measure of whole fumonisins in corn of Philippines and Vietnam was 0.3 to 10 335 mg/kg and 0.3 to 9.1 mg/kg, respectively.
- 336 Contamination of Taiwan's corn with fumonisins was investigated by [92], [72] and [93].
- 337 The incidence of fumonisins in corn of India declared by [94] and [95].
- 338 [72] and [91] reported the contamination of corn in Australia and the highest fumonisins level was 40.6 339 mg/kg.
- 340

# 341 **5.3 Europe**

- 342 [96] published a review article on information about the occurrence of fumonisins from some 343 European nations (Croatia, Poland, Portugal, and Romania). [97] reported the highest concentration 344 of fumonisins in Croatia was 25,200 ng/g, and mean value was 4,509 ng/g.
- 345 In Spain, contamination of corn with fumonisins investigated by [98], [99], [100], and [101]. Also, [102] 346 reported the concentration of fumonisin  $B_1$  and  $B_2$  in wheat and barley.<br>347 Fumonisin B<sub>1</sub> was not found in wheat and barley of France [103].
- 347 Fumonisin  $B_1$  was not found in wheat and barley of France [103].<br>348 [104] reported the corn contamination with fumonisin  $B_1$  in Austria
- 348 [104] reported the corn contamination with fumonisin  $B_1$  in Austria.<br>349 In oat, barley and wheat of United Kingdom [105] have not detecte
- In oat, barley and wheat of United Kingdom [105] have not detected fumonisins but [106] declared the 350 concentration of fumonisin  $B_1$  in corn of UK (0.2 to 6 mg/kg).
- 351

# 352 **5.4 Africa**

- 353 Albeit majority African territory has a weather distinguished by high temperature and high humidity 354 that suitable for the development of molds, little data is accessible on the occurrence of toxins of
- 355 *Fusarium*. High infection of the basic material is a developing problem. Regulative problems are not
- 356 accessible in the territory of food retailing and exhibition, and mycotoxin issues now have been
- 357 combined with some food infection in some parts in Africa [107].
- 358 The infection of corn with fumonisins in South Africa was reported by [108], [109], [93], [110], [111] 359 and [112]. Based on these studies the most extreme concentration of fumonisin B1, B2 and B3 were 360 117.5 mg/kg, 22.9 mg/kg and 0.6 mg/kg respectively.
- 361 A high measure of fumonisins (12 mg/kg) was also detected in corn from Benin [113].
- 362 [114] have detected the fumonisin  $B_1$ ,  $B_2$ , and  $B_3$  in corn of Ethiopia.
- 363 Corn from Ghana and Morocco was also infected with fumonisins [115]; [116].
- 364
- 365

## 366 **6. DIETARY INTAKE**

- 367 In the European diet, the total intake of  $FB<sub>1</sub>$  has been evaluated at 1.4  $\mu$ g/kg of body weight/week<br>368 [117]. Daily intake of fumonisins in varies countries and foods, were summarized in Table 4. [117]. Daily intake of fumonisins in varies countries and foods, were summarized in Table 4.
- 369 In [117]; [118] articles, tolerable daily intake (TDI) of  $FB_1$  was reported 800 ng/kg. Also, provisional-<br>370 maximum-tolerable-daily-intake (PMTDI) of fumonisin was noted 2 µg/kg of body weight per day on maximum-tolerable-daily-intake (PMTDI) of fumonisin was noted 2 µg/kg of body weight per day on
- 371 the basis of the no-observed-effect-level (NOEL) of 0.2 mg/kg of body weight/day and a safety aspect 372 of one hundred.
- 373 By means of the simulation model, mean concentrations of fumonisin  $B_1$  in milk were evaluated 0.36<br>374 ug/kg. Whenas the pretended tolerable daily intakes (TDI) from milk for females and males fell lesser
- μg/kg. Whenas the pretended tolerable daily intakes (TDI) from milk for females and males fell lesser 375 European Union guidelines [119].
- 376 [14] demonstrated that feces are the major way of excretion of fumonisin B<sub>1</sub> in rabbits, by comparing  $377$  the concentration of  $FB<sub>1</sub>$  in urine, liver and feces.
- 
- 378

#### 379 **Table 4. Daily intake of fumonisins for different countries and foods**

#### 382 **7. MAXIMUM LIMITATION**

 There are different variables that may affect the foundation of tolerances for specific mycotoxins, such as the delivery of mycotoxins through products, regulations of trade contact in different countries, availability data of toxicological or dietary exposure, and the accessibility of techniques for analysis 386 [120].

387 Deadline level for fumonisins in maize and other cereals, at the moment change from 5 to 100000 388 µg/kg. Present laws of fumonisins in feeds and foods set by nations from America, Africa, Europe, 389 and Asia and described by [121]; [122] and denoted in Table 5.

390<br>391
