

Editor's Comment:

This manuscript is not eligible to be accepted in BJPR at the current format. I showed my comments and modifications over enclosed file.

The following issues must be passionately revised by authors:

1. Please focus on phytochemicals of methanol extract in literature and bring their evidences of pharmacological activities in both introduction and discussion. For example, which compound of your herb may have antidiabetic activity and why?
- 2- Please avoid duplication of results and explain your chief findings in text then table or figure.
- 3- The unit of any measurement must be defined and reflected in methodology or results, tables or graphs.
- 4- Since this is an impressive and informative work done by different scientists, we have heterogeneous writing style please one scientist or an invited editor makes it homogeneous.

If the feedback of authors satisfies me, I consider it for final decision. At the present format this manuscript is rejected because BJPR must build its big future therefore it is time for it to be selective not collective journal.
