Driginal research Articles IN-VITRO EVALUATION OF ANTIBACTERIAL AND ANTIFUNGAL EFFICACY OF BOSWELLA DALZIELII STEM BARK EXTRACTS

ABSTRACT

The efficacy of Boswella dalzielii (Frankincense) stem bark extracts on some bacterial and 5 fungal organisms was evaluated for its in-vitro antimicrobial activities against Staphylococcus 6 aureus, Streptococcus pyogenes, Escherichia coli, Salmonella gallinarium, Aspergillus 7 fumigatus and Candida albicans. The research work was carried out in Biochemistry and 8 Microbiology Laboratories of Federal College of Animal Health and Production Technology, 9 National Veterinary Research Institute, Vom. Well diffusion method was carried out on 10 nutrient agar. MIC, MBC and MFC of the test organisms were carried out on nutrient broth. 11 The phytochemistry revealed the presence of saponin, tannin, flavonoids, cardiac glycosides, 12 steroids, terpens and phenol in ethanol extracts while resin, alkaloid and glycosides were 13 14 absent in hot water extracts. Alkaloid was also absent in ethanolic extract. The aqueous extract of the plant exhibited neither antibacterial nor antifungal effects against all test organisms used 15 16 in the study while the ethanolic extract of the plant showed both antibacterial and antifungal effects on the study organisms. The results of this study also 17 showed that the ethanolic extract of Boswellia dalzielli stem bark has activity against all 18 bacteria species used in the study (broad spectrum activity). For gram-negative and positive 19 bacteria, Salmonella gallinarium and Staphylococcus aureus were the most sensitive while 20 Escherichia coli and Streptococcus pyogenes were the least respectively. Candida albicans 21 was more sensitive than Aspergillus fumigatus. It was concluded that the test organisms were 22 susceptible to ethanol extracts of the plant and may be good source of antibiotics. 23

INTRODUCTION

Herbal medicine is the oldest form of medicine known to mankind [1, 2]. It was the mainstay 26 of many early civilization and still the most widely practiced form of medicine in the world 27 today [3]. Many people in developing countries still rely on traditional healing practices and 28 medicinal plants for their daily healthcare needs, in spite of the advancement in modern 29 30 medicine [4]. Traditional medicine which is widespread throughout the world has been recognized by World Health Organization (WHO) as an essential building block of primary 31 health care. According to reports of World Health Organization, 80% of the world's 32 population relies mainly on traditional therapies which involve the use of plants extracts or 33 their active substance [5]. There is abundant undocumented traditional knowledge of herbal 34 remedies used to treat diseases in most cultures [6]. Different traditional healing practices 35 worldwide are designed for either therapeutic or prophylactic use in human or animal diseases 36 [7, 8]. Several studies carried out in Africa, Asia, Europe, Latin America and North America 37 show that plants are routinely used as remedy for animal diseases [9-14]. Historically, it is 38 documented that humans utilize the same herbal preparations that they use to treat their sick 39 animals [15]. In Nigeria, farmers are known to treat animal diseases with herbs and other 40 traditional medical practices before the advent of orthodox medicine [16]. Traditional medical 41 42 and veterinary practices remain relevant and vital in many areas in Nigeria due to absence or

inadequate provision of modern medical services particularly in rural areas [17]. Ethnoveterinary medical practice is widespread among herdsmen and native livestock producers in
northern Nigeria. Traditional remedies in this area include plant extracts from different plant
parts [18]. Herdsmen in non-industrialized nations of the world still use medicinal plants for
the treatment of livestock diseases, either due to lack of access to trained veterinarians and
high cost of orthodox medicines, or the held belief that herbal remedies are more efficacious
[19].

Plants are also potential sources of modern drugs. A recent survey of United Nations Commission for trade and development (UNCTAD) indicated that about 13% of drugs produced within developed countries are derived from plants [20]. Surprisingly, this large quantity of modern drugs comes from less than 15% of the plants, which have been known to have been investigated pharmacologically [21]. Therefore, since there are so many of these naturally occurring substances in plants, it is obvious that the plant kingdom offers better opportunity of providing useful medicinal compounds.

Boswellia dalzielii (family Burseraceae), commonly known as frankincense tree; abounds in 57 the Savannah regions of West Africa. The plant has several medicinal uses. The decoction of 58 the stem bark is used to treat rheumatism, septic sores, venereal diseases and gastrointestinal 59 ailments [22, 23]. Phytochemical studies of the plant revealed the absence of alkaloids [24], 60 while saponins, tannins, flaonoids, cardiac glycosides, steroids, and terpenes were found to be 61 present [25, 26]. Oil from the leaves of Boswellia dalzielii was found to exhibit significant 62 activity against Staphilicoccus aureus, Bacillus subtilis and Candida albicans [27]. The 63 methanolic and aqueous extracts showed antibacterial and antifungal activities [28, 26]. 64 Recent studies of the aqueous extract of the stem bark of Boswellia dalzielii showed no 65 66 antimicrobial activity against all the microbes, used, however, produced some anti-ulcer activity [25]. In another recent study, incensole was found to be part of the chemical 67 composition of the stem-bark of Boswellia dalzielii [29]. 68

Now-a-days, the problem of antimicrobial resistance is growing and the outlook for the use of 69 antimicrobial drugs in the future is still uncertain. In general, bacteria have the genetic ability 70 to transmit and acquire resistance to drugs, which are utilized as therapeutic agents [30]. 71 72 Laboratories of the world have found literally thousands of phytochemicals which have 73 inhibitory effects on all types of microorganisms in vitro [31]. Unfortunately, development of effective antimicrobial agents has been accompanied by the emergence of drug-resistant 74 organisms due to the irrational and over-use of antibiotics, failure to complete a course of 75 76 treatment, genetic versatility of microbes and horizontal transfer of resistant genes among bacterial species. All the mentioned factors diminish the clinical effectiveness of antibiotics 77 78 [32, 33].

In recent time, there has been renewed interest on plants as sources of antimicrobial agents due to their use historically and the fact that a good portion of the world's population, particularly in developing countries n rely on plants for the treatment of infectious and noninfectious diseases [34]. The aim of the research is to determine the susceptibility of some bacterial and fungal organisms to the ethanolic and aqueous plant extracts and also to determine the minimum antibacterial and antifungal concentrations of the plant extracts.

87

88

MATERIALS AND METHODS

89 METHODOLOGY

The Standard qualitative method as described by Sofowora, [35] was used for phytochemical screening of the plant using ethanol and hot water as the solvents in the biochemistry laboratory. Well diffusion and tube dilution methods were used to determine the antimicrobial properties, minimum inhibitory concentration and minimum bacteriocidal concentration concentrations of the plant extract as described by Cheesbrough, [36] while minimum fungicidal concentrations of the plant extract was determined as described by Picman *et al.* [37].

97 PHYTOCHEMICAL SCREENING

98 The herb Boswellia dalzielii was obtained from National Veterinary Research Institute, Vom. This herb was identified as *Boswellia dalzielii* by Mr. Okonkwo, a plant taxonomist attached 99 to the Federal College of Forestry, Jos. The powdered stem bark (100g) was extracted 100 101 exhaustively with petroleum ether 60-80°C in a Soxhlet apparatus for 24hrs. The marc was air dried and re-extracted with ethanol. The aqueous and ethanolic extracts were separately 102 evaporated under reduced pressure to give solid residues weighing 10.76g and 21.82g, 103 respectively. The residues were then subjected to phytochemical screening using standard tests 104 105 to show the different types of phytochemical constituents present in the stem [35, 38-40].

106 107

SOURCE OF THE ORGANISMS

The organisms were collected from the Central Diagnostic Laboratory of the National
Veterinary Research Institute Vom and the work was carried out in college Microbiology
Laboratory, Federal College Animal Health and Production Technology Vom, Plateau State.
Six strains of Microorganisms were collected in their appropriate culture media. These
organisms were *Escherichia coli, Salmonella gallinarum, Staphylococcus aureus, Aspergillus fumigatus, Candida albicans* and *Streptococcus pyogenes*.

114

115 SENSITIVITY TEST USING WELL DIFUSSION METHOD

Molten nutrient agar was prepared and 0.2ml of the organism from the broth culture was inoculated into molten nutrient agar and was pour plated and was left on the bench to solidify [41]. Six wells were bored using sterile borer. The extract were dispensed into each well using a sterile micropipette at different concentrations of 500mg/ml, 250mg/ml, 125mg/ml, 62.5mg/ml and 31.25mg/ml. Gentamycin and Miconazole were used as positive controls for both bacterial and fungal organisms respectively. The plates were incubated at 37°c for 24 hours.

123 DETERMINATION OF MINIMUM INHIBITORY AND MINIMUM 124 BACTERIOCIDAL CONCENTRATIONS

Tube dilution method was used in varying concentration of the liquid media and the extracts in test tubes at 500mg/ml, 250mg/ml, 125mg/ml, 62.5mg/ml and 31.25mg/ml were dispensed in tubes, and 0.2ml of the standardized organism was also dispensed in the same tubes. The tubes were incubated at 37°c for 24 hours, positive control were also setup. The least concentration without growth gives the MIC. The MIC is then subcultured into a broth culture tubes that contain no extracts, the lowest concentration that result in no growth of the subcultured is noted which indicated MBC, [36].

132 DETERMINATION OF MINIMUM FUNGICIDAL CONCENTRATION

The hyphal growth inhibition test was used to determine the antifungal activity of the plant 133 extract against fungal strains as previously described Picman et al. [37]. Briefly, dilutions of 134 the test solutions dissolved in vehicle were added to sterile melted PDA at 45° C to give final 135 concentrations of 500mg/ml, 250mg/ml, 125mg/ml, 62.5mg/ml and 31.25mg/ml of plants 136 137 extracts. The resultant solution was thoroughly mixed and approximately 15 mL was poured onto the petri plate. Plugs of 1 mm of fungal mycelium cut from the edge of actively growing 138 colonies were inoculated in the center of the agar plate and then incubated in a humid chamber 139 at 25°C. Control cultures also received an equivalent amount of vehicle. Three replicates were 140 141 used for each concentration. Radial growth was measured when the control colonies almost reached 1.5 cm. 142

171

172 DISCUSSION, CONCLUSION AND RECOMMENDATION

173 DISCUSSION

The phytochemical screening of *Boswella dalziell* plants showed that it contains saponnin, tannins, flavonoids, cardiac glycosides, steroids, terpens and phenol in both ethanol and hot water extraction while resins and glycosides were present only in ethanolic extract but absent in aqueous extract. Alkaloids was found to be absent in both hot water and ethanol extraction (Table 1). This is in accordance with Nwinyi *et al.* [27] and Anago *et al.* [42]who reported the presence of tannin among the phytochemical properties of the plant and absence of alkaloid in their aqueous and ethanolic extracts respectively.

Hassan *et al.* [40] also reported the presence of tannins, saponins, flavonoids, cardiac
glycosides, steroids and terpenes in methanolic etract of the plant.

183 The aqueous extract of the plant exhibited neither antibacterial nor antifungal effects against 184 all test organisms used in the study (Table 2). This agreed with the report of Nwinyi *et al.*

185 [27] and Taiwo *et al.* [43] who stated that aqueous extract of the plant has no

186 antibacterial effect.

187 The ethanolic extract of the plant showed both antibacterial and 188 antifungal effects on the study organisms (Table 3). This also agreed with 189 Olukemi *et al.* [44], Nwinyi *et al.* [27], Noumbo *et al.* [45] who reported that ethanolic extract 190 from *Boswella dalziell* have antimicrobial property. According to Campbell [46], the presence 191 of substantial level saponnin, phenols and tannins in an extract encourage antimicrobial 192 properties.

The results of this study showed that the ethanolic extract of the stem bark of Boswellia 193 194 dalzielli has activity against some gram-positive and gram-negative bacteria (broad spectrum of activity) [28]. For gram-negative bacteria (Table 4), Salmonella gallinarium was the most 195 sensitive while Escherichia coli was the least. For gram-positive (Table 4), Staphylococcus 196 197 aureus was the most sensitive while Streptococcus pyogenes was the least. Candida albicans 198 was more sensitive than Aspergillus fumigatus (Table 4). In general, this herb was more active with bacteria than fungi (Tables 4). This is due to the complex nature of fungal cell wall which 199 200 makes entry of drugs and other chemotherapeutic agents extremely [47]. Nwinyi et al. [27] stated that presence tannin is responsible the antibacterial activity of Boswella dalzielli 201 ethanolic extract. According to Olukemi et al. [44], Staphylococcus aureus is very sensitive to 202 203 Boswella dalzielli ethanolic extract and also reported that gram-negative bacteria are less 204 susceptible to the extract than gram-positive. The result of the study also correlated with the 205 use of the stem bark of Boswellia dalzielii by herbal practitioners in Jos to treat gastroenteritis 206 [27].

207

208 CONCLUSION AND RECOMMENDATIONS

209 The phyto-chemistry screening revealed the presence of saponin, tannin, flavonoids, cardiac glycosides, steroids, terpens and phenol in ethanol extracts while resin, alkaloid and 210 glycosides were absence in hot water extracts. Alkaloid was also absent in ethanolic extract. 211 The aqueous extract of the plant exhibited neither antibacterial nor antifungal effects against 212 all test organisms used in the study while the ethanolic extract of the plant showed 213 both antibacterial and antifungal effects on the study organisms. The results 214 of this study also showed that the ethanolic extract of the stem bark of Boswellia dalzielli has 215 216 activity against some gram-positive and gram-negative bacteria (broad spectrum of activity). For gram-negative bacteria, Salmonella gallinarium was the most sensitive while Escherichia 217 coli was the least. For gram-positive, Staphylococcus aureus was the most sensitive while 218 Streptococcus pyogenes was the least. Candida albicans was more sensitive than Aspergillus 219 fumigatus. Root, stem and leaves extracts of Boswellia dalzielli were recommended to be tried 220 on other microorganisms to ascertain its efficacy. More so, phytotoxicity of Boswellia dalzielli 221 222 should be carried out to determine the possible toxicity of the pharmaco-active ingredients of 223 the plant.
