ABSTRACT

Aims: This study was carried out to investigate the antimicrobial activity of *Chrysophyllum albidum* leaves extract on selected Gastro-intestinal bacteria such as *Salmonella typhimurium*, *Shigella dysenteriae*, *Vibrio cholera*, *Escherichia coli* and *Clostridium perfringens*.

Methodology: The leaves were extracted using ethanol, methanol and distilled water; the concentration of the extracts employed were 100mg/ml, 200mg/ml, 400mg/ml and 500mg/ml respectively; however the leaf extracts of *Chrysophyllum albidum* were screened for antimicrobial activity using the *in vitro* cup-plate method of agar diffusion technique with concentration of 10⁻⁵ cells/ml of the selected bacteria. Simultaneously, 30µg tetracycline and 30 µg metronidazole were used as positive control.

Result: The result showed that the most active among them is Tetracycline; followed by ethanolic extract, aqueous extract, methanolic extract and metronidazole extract respectively on the tested bacteria.

Conclusion: This research justifies the traditional use of the leaves of *Chrysophyllum albidum* for the therapeutic purposes; hence can be commercialized by pharmaceutical outfit; if not for anything but its availability and readily for human consumption.

Keywords: Anti-bacterial, *Chrysophyllum albidum*, Extract, Metronidazole, and Tetracycline

20 1. INTRODUCTION

21 Antibiotics are one of the most important weapons in fighting bacterial infections and have
22 greatly benefited the health related quality of human life; since their introduction. However,
23 over the past few decades, these health benefits are under threat as many commonly used
24 antibiotics have become less effective against certain illness; not only because many of
25 them produce toxic reactions; but also due to the emergence of drug-resistant bacteria. It is
26 essential to investigate latest drugs with lesser resistance. In general; bacteria have the
27 genetic ability to transmit and acquire resistance to synthetic drugs which are utilized as
28 therapeutic agents. The emergence of multiple drug resistance bacteria (MDR) has become
29 a major cause of failure of the treatment of infectious diseases (1). As a result, society is
30 facing one of the most serious public health dilemmas over the emergence of infectious
31 bacteria displaying resistance to many antibiotics as stated by (2). The continuous spread of
32 multidrug resistance pathogens has become a serious threat to public health and a major
33 concern for the infection control by the practitioners worldwide. In addition to; increasing
34 cost of drug regimes; this scenario has paved way for the re-emergence of high frequency of
35 opportunity and chronic infection cases in developing countries. The slow pace of the newer
36 antibiotics development couple with the availability of fewer antimicrobial actions centered on
37 the inhibition of the ergosterol synthesis; has provided the need to explore nature in search
38 of the phytotherapeutic agent; work with novel targets and mode of actions.

39 *Chrysophyllum albidum* belongs to the Sapotaceae family and commonly found in Nigeria. It
40 is common throughout the tropical central, East and West Africa regions for its sweet, edible
41 and various ethno-medical uses. The plant is known as *Agbalumo* in Yoruba language in
42 Nigeria. *Chrysophyllum albidum* fruits (known as African star apple) are widely eaten in
43 Western and Southern Nigeria. The fruit is seasonal (December-March); when ripe, it is
44 ovoid to sub-globose, pointed at the apex and up to 6cm long and 5cm in diameter.
45 *Chrysophyllum albidum* leaves are used by the traditional medicine practitioners in Nigeria in
46 the management and treatment of several disorders which include skin eruptions, diarrhoea
47 and stomach-ache which are as a result of infection and inflammatory reactions (3). (4)
48 Confirmed the antimicrobial effects of the seed oils from *Chrysophyllum albidum*. (5);
49 validated the antibacterial activity of the *Chrysophyllum albidum* aqueous and methanolic
50 leaves extracts. The methanolic extracts had stronger inhibitory effects on test
51 microorganisms. *Chrysophyllum albidum* cotyledons are useful for the treatment of vaginal
52 and dermatological infections (6). According to the (6); cotyledons of the *Chrysophyllum*
53 *albidum* were also active against *Candida albicans* and *C. pseudorotropicalis*. The presence
54 of the tannins in the seed cotyledon leaves and stem slash have also been reported
55 by many researchers and these plant parts have anti-inflammatory effect which

help control all indications of gastritis, oesophagitis, enteritis and irritating bowel disorders (7,8). Both the stem slash and seed cotyledon possess very high levels of alkaloids and flavonoids, and the latter show anti-allergic, anti-inflammatory, anti-microbial and anti-cancer activity (9). These alkaloids may be toxic chemical element in the seed cotyledon; used as a remedy for fever; while the stem slash is used as emollients and for the treatment of skin eruptions, diarrhoea and stomach ache; which are as a result of infections and inflammatory reactions (10). The efficacy of the seed against vaginal infections and dermatological infections was confirmed by (11) and also its activity against *Candida albicans* and *C. pseudotropicalis*; this further explains the therapeutic and medicinal properties of the *Chrysophyllum albidum* and supported the use of this plant as an external application for the skin eruptions diseases. It has been observed that tannins are responsible for the anti-diarrhoeal activity (12). Evaluation of the potentials of *Chrysophyllum albidum* in wound care showed that the cotyledon extract exhibited haemostatic, antimicrobial and wound healing activities (13).

Due to wide use in ayurvedic medicine in Africa, we design to study the antibacterial potential of *Chrysophyllum albidum* leaves extract.

2. MATERIAL AND METHODS

2.1 Collection of Material

Fresh leaves of *Chrysophyllum albidum* was plucked from its plants growing on the Power Line way; Magboro, Ogun State and identified in herbarium of Department of Botany of the University of Lagos. The drugs used as control for this study were tetracycline and metronidazole and bought from a registered pharmacy at Ikorodu. The test organisms were obtained from Federal Institute of Industrial Research, Oshodi (FIIRO) Lagos, Nigeria.

2.2 Preparation of Extract

The leaves of *Chrysophyllum albidum* were thoroughly washed and rinsed with distilled water. The leaves were air dried for 14 (fourteen) days at room temperature and grounded into fine powder using grinding machine. 30g of the finely ground sample was weighed into three different 500ml beakers of the extracting solvents e.g distilled water, methanol and ethanol respectively and kept in a dark cupboard for five days. The samples were aseptically filtered using Whatman no 4 filter paper. The resultant extracts were each concentrated

using rotary evaporator model (Buchi Rotarvapour R-114) which ensures evaporation of bulky solutions to small volume concentrates without bumping at temperature 40°C. The resultant extracts were sterilized using Millipore filter (0.45µm) and then used for the antibacterial activity.

2.3 Phytochemical Screening

The phytochemical analysis was carried out using the method described by (14). The plant extracts were screened for the presence of tannins, saponins, flavonoids, steroids, glycosides, terpenoids, alkaloids and phenolic compounds.

Test for tannins: About 0.5 g of the dried powdered samples was boiled in 20 ml of water in a test tube and then filtered. A few drops of 0.1% ferric chloride was added and observed for brownish green or a blue-black colouration.

Test for saponins: 1g of the each sample was weighed into a conical flask in which 10ml of sterile distilled water was added and boiled for 5 min. the mixture was filtered and 2.5ml of the filtrate was added to 10ml of sterile distilled water in a test tube. The test tube was stopped and shaken vigorously for about 30second. It was then allowed to stand for half an hour. Honeycomb froth indicated the presence of saponins. Appearance of an oil stain or a grease spot on the filter paper when observed under direct sunlight indicated the presence of fixed oils.

Test for Flavonoids: Two milliliter filtrate was added to conc. HCl and magnesium ribbon. Pink-tomato red colour indicated the presence of flavonoids.

Test for Steroids: 0.5ml of the each extract was dissolved in 3ml of chloroform and was filtered. To the filtrate, concentrated sulphuric acid was added by the sides of the test tube, which formed a lower layer. A reddish brown was formed.

Test for glycosides: 2ml of extract with the addition of hydrochloric acid solution (HCl) was neutralized with sodium hydroxide (NaOH) solution, then few drops of ferric chloride solution (FeCl₃) was added as well with 1ml of concentrated H₂SO₄ sulphuric acid underlaid. A reddish brown ring at the interface was observed, indicating the presence of cardiac glycosides in all the extracts.

Test for terpenoids (Salkowskitest): 5ml of each extract was mixed in 2ml of chloroform, and concentrated H₂SO₄ (3ml) was carefully added to form a layer. A reddish brown colouration of the interface was formed to show positive results for the presence of terpenoids.

124 **Test for alkaloids:** 1cm³ of 1 % HCl was added to 3cm³ of each extract in a test
125 tube. Each extract treated with a few drop of Meyer's reagent. A creamy white precipitate
126 was observed indicating the presence of alkaloids.

127 **Test for phenolic compounds:** 2ml of extract was added to 5.0ml of 95% ethanol; they
128 were boiled in water bath for five minutes and filtered hot. 5.0ml of distilled water was added
129 and the ethanol was evaporated at a reduced pressure in the water bath. The resultant
130 concentrate with the addition of five drops of 1% of Ferric Chloride and 1% Potassium Ferric
131 cyanide solution were added. A violet, wine, red, purple colour was developed, indicating a
132 positive test for phenolic compounds.

133

134

135 **2.4 Sensitivity Test**

136 The antimicrobial tests of the plant extract were carried out on the five selected Gastro-
137 intestinal; namely; *Salmonella typhimurium*, *Shigella dysenteriae*, *Clostridium perfringens*,
138 *Vibrio cholera* and *Escherichia coli*. Mueller Hinton agar was prepared for the test according
139 to the manufacturer prescription. Test organisms were cultured and incubated overnight;
140 after which a suspension of each test organism was made to give a concentration of about
141 10⁵ cells/ml.

142 The leaf extracts of *Chrysophyllum albidum* were screened for the anti-microbial activity
143 using the *in vitro* cup-plate method of agar diffusion technique (15). Aliquot of 1ml of the test
144 organism suspensions was inoculated using micropipette with sterile tips; dropped onto the
145 agar surfaces respectively. The bacterial suspension was spread aseptically on the agar
146 surface; with the aid of hockey stick. The plates were allowed to absorb the organism
147 suspensions at room temperature. A sterile cork borer of diameter 5mm was punched on the
148 agar surface to make four wells; for ethanolic, methanolic and aqueous plates and filled with
149 100mg/ml, 200mg/ml, 400mg/ml and 500mg/ml of the plant extracts each respectively.
150 Simultaneously, tetracycline (30 µg) and metronidazole (30 µg) were used as positive
151 control. Control wells containing the same volume (100 µl) of distilled water, methanol and
152 Ethanol were made. The plates were incubated at 35°C overnight. The antibiogram plates
153 were observed for zones of inhibition. The bacterial strains resistant to antimicrobial agent
154 grew up to the edges of the well as against the sensitive strain which were inhibited at a
155 distance from the well. The zones of inhibition around each well were measured using a
156 transparent metric ruler in millimetres (mm) and the average diameter was taken.

157

158

3. RESULTS

The ethanolic, methanolic and aqueous extracts are dark green, light green and brown respectively. The plant extracts were screened for the presence of Tannins, Saponins, Flavonoids, steroids, Glycosides, Terpenoids, Alkaloids and Phenolic compounds.

204

205

206 4.0 DISCUSSION

207 The ethanolic extract was dark green; the methanolic extract was light green while the
208 aqueous extract was brown. The most abundant ingredients were tannins, flavonoids and
209 glycosides. Pytochemicals analysis of the extracts indicated the presence of typical
210 plant constituents such as alkaloids, saponins, tannins and phenolic compounds;
211 however, the phenolic compounds in *Chrysophyllum albidum* may be responsible for the
212 therapeutic, antiseptic, antifungal or bacterial properties of the plant. (16)

213 Antimicrobial activity of *chrysophyllum albidum* leaf extract were tested against four
214 selected gram-negative bacteria such as *Salmonella typhimurium*, *Shigella dysenteriae*,
215 *Vibrio cholera*, and *Escherichia coli*, then one gram-positive bacteria which is *Clostridium*

216 *perfringens*. They were compared with tetracycline and metronidazole. The result showed
217 that the maximum inhibitory zone for ethanol extract on *Salmonella typhimurium* is 39mm at
218 500mg and the minimum inhibitory zone was 23.5mm at 100mg; for *Shigella dysenteriae* the
219 highest maximum inhibitory zone is 34mm at 100mg and the minimum inhibitory zone is
220 28mm at 500mg. The maximum inhibitory zone for the *Clostridium perfringens* is 30mm at
221 500mg and the minimum inhibitory zone is 26mm at both 100mg and 400mg; for the *Vibrio*
222 *cholera*; the maximum inhibitory zone is 26.5mm at 500mg while the minimum inhibitory
223 zone is 23.5mm at 100mg, the maximum inhibitory zone for the *Escherichia coli* is 30mm at
224 400mg while the minimum inhibitory zone is 25mm at 100mg.

225 The methanolic extract showed the following zones of inhibition; for the *Salmonella*
226 *typhimurium* the maximum inhibitory zone is 35.5mm at 500mg while the minimum inhibitory
227 zone is 33mm at both 200mg and 400mg; for *Shigella dysenteriae* the maximum inhibitory
228 zone is 28mm at 400mg while the minimum inhibition inhibitory zone is 21mm at 100mg; for
229 the *Clostridium perfringens*, the maximum inhibition concentration is 28mm at 200mg while
230 the minimum inhibitory zone is 23mm at 100mg. The maximum inhibitory zone of *Vibrio*
231 *cholera* is 31mm at 500mg while the minimum inhibitory zone is 23mm at 100mg and for
232 *Escherichia coli* the maximum inhibitory zone is 29mm at 500mg while the minimum
233 inhibitory zone is 20.5mm at 100mg. (5); validated the antibacterial activity of *Chrysophyllum*
234 *albidum* leaves aqueous and methanolic extracts; while the methanolic extracts had stronger
235 inhibitory effects on test microorganisms.

236 The aqueous extract showed the following zones of inhibitions; for *Salmonella typhimurium*
237 the maximum inhibitory zone is 37mm at 500mg while the minimum inhibitory zone of
238 28.5mm at 100mg; for the *Shigella dysenteriae* there was no zone of inhibition at both
239 100mg and 200mg but the minimum inhibitory zone is 18mm at 400mg, for *Clostridium*
240 *perfringens* the maximum inhibitory zone is 29mm at 500mg while the minimum inhibitory
241 zone is 26mm at both 100mg at 400mg; for the *Vibrio cholerae* the maximum inhibitory zone
242 is 33mm at 500mg while the minimum inhibitory zone is 21mm at 100mg; however, for
243 *Escherichia coli* the maximum inhibitory zone is 27mm at 500mg while the minimum
244 inhibitory zone is 17mm at 100mg. (5); validated the antibacterial activity of *Chrysophyllum*
245 *albidum* leaves aqueous extract.

246 The antibiotics used showed that the following zones of inhibition; for tetracycline, the
247 maximum inhibitory zone is 39.5mm on *Shigella dysenteriae* at 30mg; while the minimum
248 inhibitory zone was 33mm on *Escherichia coli* at 30mg; for the Metronidazole; the maximum
249 inhibitory zone is 34.5mm on *Escherichia coli* at 30mg while the minimum inhibitory zone
250 was 28mm on *Vibrio cholerae* at 30mg. The antimicrobial activity of *Chrysophyllum*
251 *albidum* extract showed potent inhibition on some microorganisms. *Chrysophyllum*

252 *albidum* root extracts successfully inhibited *P. aeruginosa*, *E. coli*, *S. aureus*, *C.*
253 *tetani*, *B. subtilis*, and *C. albicans*. The stem slash also showed potent inhibition on
254 these microorganisms,(Okoli and Okere,2010)(16).

255 The result showed that Tetracycline was more effective amongst all; followed by ethanolic,
256 aqueous, methanolic extract and Metronidazole. However; the discriminate and proper use
257 of some herbal products is safe and may provide some therapeutic benefits, but the
258 indiscriminate or excessive use of herbs can be unsafe and even dangerous (17)

259
260
261

262 **5.1 Conclusion**

263 The result of this work justifies the traditional use of the leaves of *chrysophyllum albidum* for
264 therapeutic purposes. The findings could also be of commercial interest to both
265 pharmaceutical companies and research institute in the production of new drugs. The plant
266 extract has active ingredients which are able to inhabit the growth of microbes that are
267 capable of causing gastro-intestinal diseases. However; ethanolic extract was very active
268 amongst the other extracts used, hence it is highly recommended that ethanol should be
269 used for extraction of this plant; whenever is to be used to cure gastro-intestinal ailment
270 caused by these selected organisms used in this work.
