

Editor's Comment:

1. Introduction: had so many sentences not backed with citations

2. Methods

Was pregnancy test conducted on the participants? if yes, where are the results

Was a random blood sugar to determine or rule out Diabetes mellitus conducted on the research participants? If yes, where are the results? Was there any other confirmatory test for Diabetes mellitus conducted? If yes, where are the results?

The conclusion is not clear, there is no statement on conflict of interest

Most notable in the method is the deficiency or the lack of description on how the microorganisms were identified. If this was an omission in the manuscript, it should be included

How the isolates were identified and confirmed. How the confirmation of the various microorganisms were undertaken.

The References need to be redone

In the current form, I advise that unless those several amendments are made, it can not be published in this status
