

Editor's Comment:

Paper is not in good shape yet. Note that the description of incorporation of problems indicated by reviewers cannot be implemented by simple writing that the comments were considered... From the formal point of view, the language should be improved, still there are many items to be corrected.

From technical point of view, the system (1) of differential equations has fallen from the sky = there should be some justification, why exactly this model is relevant!

The remaining technical part looking for equilibrium looks OK = but clearly it is heavily related to the chosen system (1).

Numerical simulations were mentioned, but not included into the paper (and this was already commented by reviewers, too!!!).

I cannot recommend to publish the revised version in its actual form.
