

Editor's Comment:

These explanations and corrections in the text improve the value of the article.

The explanation of statistical tests is still insufficient due to the lack of a variance test. If the assumption of equality of variance has been checked, the tests quoted (Tukey, Dunnett - please correct the spelling in the text) are correct. But if the assumption of equality of variance is not met, then other tests have to be applied. Hence, information is needed about checking the assumption about the equality of variance.

All this should be written down in the text, in the Materials and Methods chapter.
