

**Editor's Comment:**

I went through the reviewer's suggestions and the revised manuscript. Now the manuscript looks far better than the earlier versions. I think reviewers did a great job and the comments are useful and informative. Also, increase the manuscript strength and readers can easily follow the content. I still see some syntax and grammatical errors throughout the manuscript. I would suggest to authors to carefully go through the manuscript one more time carefully and correcting all errors. Another important suggestion is it would be nice if authors include one of the representative agar plates (MaCconkey agar and Blood agar) which showed a positive for rod and cocci shape bacteria and for other biochemical tests as a figure. that makes it easier for the reader can easily understand results easily.

I think authors nicely characterized gram-negative bacteria isolated from tomatoes obtained from the market and results are one of the important data to ensure food hygiene management in this area. I recommend that the Manuscript can be accepted for publication with small changes.
