

# **Empirical Analysis on the Impact of Poverty Alleviation by Rural E-commerce on Farmers' Income**

---

## **ABSTRACT**

According to the data of 200 valid questionnaires collected in 11 poor villages of 7 townships, 5 counties in Zhumadian region, this paper use the DID model to calculate the change difference of the per capita net income, per capita agricultural operating net income, and per capita non-agricultural net income between the farmers who have participated or so, then use the SPSS(20.0) software to do the significant test. Based on this, this paper used the fixed effect model to analyze the effect of other control variables on the farmers' income. The research results are as follows: The rural E-commerce poverty alleviation has a significant positive impact on per capita net income, per capita net agricultural operating income, and per capita non-agricultural net income of farmers, and can change the income structure of the farmers' family in the short term.

## **1. INTRODUCTION**

16  
17  
18  
19  
20 In November 2016, the State Council Poverty Alleviation Office, together with the National  
21 Development and Reform Commission, the Central Network Information Office, the Ministry  
22 of Commerce and other national ministries and commissions in China jointly issued the  
23 "Guiding Opinions on Promoting Accurate Poverty Alleviation for E-commerce", which first  
24 proposed the guiding ideology and overall objectives, basic principles, main tasks and  
25 safeguards, etc., of rural e-commerce poverty alleviation. The top-level design for rural e-  
26 commerce poverty alleviation has initially been completed. Since then, relevant ministries  
27 and commissions of the State Council of the People's Republic of China have successively  
28 issued a large number of supporting policy documents, fully supporting poor rural areas to  
29 formulate medium and long term plans and implementation rules for rural e-commerce  
30 poverty alleviation according to their actual conditions. Under this background, the  
31 Zhumadian area in Henan Province vigorously promotes the rural e-commerce precision  
32 poverty alleviation project, and strives to solve the problems of restricting the development of  
33 e-commerce in poor counties and poor villages and the implementation of rural e-commerce  
34 poverty alleviation projects, and promotes characteristic industries and rural e-commerce to  
35 integrated development in poor counties and poor villages. It is benefit to transform the  
36 advantages and resources of poverty-stricken counties and poverty-stricken villages into  
37 incomes of farmers, and help more poor farmers to participate in various ways such as e-  
38 commerce, offline employment, online sales, land transfer, and share-based dividends. The  
39 local e-commerce poverty alleviation activities expand the income sources of poor  
40 households, and steadily increase household income levels. Therefore, the studying of the

41 rural e-commerce poverty alleviation has significance for the implementation of e-commerce  
42 poverty alleviation in other regions.

43

## 44 **2. RURAL E-COMMERCE POVERTY ALLEVIATION**

45

46 In December 1984, the World Telecommunication Development Independent Commission  
47 issued The Missing Link, also known as the Maitland Report or the Report of the Maitland  
48 Commission, clearly stating to strengthen the infrastructure construction of information and  
49 communication technologies(ICT) in developing countries[1], improving communication  
50 conditions for urban and rural residents, expanding information communication and  
51 exchanges, driving the country's economic take-off and development, and reducing the size  
52 of the poor. This report is the earliest research literature on the field of information poverty  
53 alleviation. It has pioneered the use of ICTs to reduce poverty in developing countries. It  
54 provides the most primitive theoretical guidance for developing countries to carry out  
55 information poverty alleviation in the practice.

56 At present, scholars have carried out theoretical and practical discussions on information  
57 poverty alleviation, rural e-commerce, and rural e-commerce poverty alleviation. Charles  
58 Kenny argues that information and communication technology (ICT) is a powerful tool for  
59 empowering and increasing income in developing countries [2]. It also points out that  
60 broadcasting and telephone are the most suitable communication tools for the poor, and the  
61 government should concentrate on opening private and community broadcasts. Expand the  
62 use of telephone services to effectively play the positive role of information and  
63 communication technologies in promoting poverty alleviation and poverty alleviation in poor  
64 areas. Adeniji [3] studied how information and communication technologies can improve the  
65 utility of small producers in Nigeria, pointed out that the advantages and potential of  
66 information and communication technologies are in enhancing food security and alleviating  
67 poverty. Burga and Barreto [4], Shimamoto et al, [5] found that the widespread use of the  
68 Internet and mobile phones have a significant positive effect to understanding market  
69 information for farmers, increase agricultural product sales prices, increase agricultural  
70 product sales, and increase rural employment and improvement of production and living  
71 conditions based on rural survey data from Peru and Cambodia. Nora Abdalla Hassan  
72 Basher [6] pointed out in the study of poverty in Sudan that information and communication  
73 technologies have an important impact on people's awareness, education, health,  
74 employment, environment, social equity, agriculture and grazing. The government should  
75 formulate the correct investment, resource policies and rules and regulations to create a  
76 good development environment, promote the progress of information and communication  
77 technology in poverty-stricken areas, and benefit its economic and social development and  
78 poverty improvement.

79 Zheng Wensheng et al. [7] believed that rural e-commerce has potential economic  
80 advantages, such as online cooperation could bring opportunities with low input and high  
81 output effects, reduce information asymmetry of farmers, reduce transaction costs, and  
82 achieve effective resource allocation through transaction monitoring, reduce market risks  
83 and so on. Based on the field research of Shaji Town in Jiangsu Province, Wang Xiangdong  
84 [8] believed that poor farmers could use the Internet and third-party e-commerce trading  
85 platforms to create online stores, directly connect to the online consumer market, master  
86 order rights and pricing power, and get rid of information weakness, and engage in online  
87 sales of offline industries, achieve stable employment, obtain wage income, raise household  
88 income levels, and then achieve income increase and poverty decrease .The farmers' C2C  
89 direct sales (ie, farmer's online shop) were simple, fast and easy-to-follow new ways for  
90 farmers to sell. The rich product categories, perfect brands, flexible promotion methods and

91 effective rights protection were continuing to expand the sales of store products and the  
92 increase of farmers' income.

93 Zhu Jiarui et al. [9] conducted a comprehensive and in-depth analysis of the unique  
94 characteristics, construction principles and processes of rural e-commerce poverty  
95 alleviation model, and believed that the role of poverty alleviation in promoting rural e-  
96 commerce poverty alleviation was directly related to e-commerce rural poor poverty  
97 alleviation. According to the different roles of poverty alleviation, the rural e-commerce  
98 poverty alleviation models were defined the public institution-led model, the agricultural  
99 enterprise-led model and the professional cooperative-led model. The advantages and  
100 disadvantages of these three models were further analyzed. On this basis, Zhang Yan et al.  
101 [10] and Meng Baocheng et al. [11] further defined the rural e-commerce poverty alleviation  
102 models of an individual business model, a cooperative operating model, an enterprise-driven  
103 poverty alleviation model, a public institution-led model, and commissioned professional  
104 operators model.

105 Ma Zebo [12] based on the questionnaire survey of 630 farmers in the frontier ethnic areas,  
106 from the perspective of farmer endowment and regional environment, analyzed the  
107 willingness of farmers to participate in rural e-commerce poverty alleviation and its  
108 influencing factors. The results showed that the higher the education level, the stronger the  
109 willingness of participation; the lower the household income level, the greater the probability  
110 of participation. The perfect e-commerce logistics system, the moderate scale of agriculture,  
111 the high degree of standardization of agricultural products, and the government's vigorous  
112 promotion could help to encourage farmers to participate in rural e-commerce poverty  
113 alleviation activities. The farmers' low awareness of rural e-commerce, the lag of e-  
114 commerce infrastructure construction in poverty-stricken areas, the lack of rural e-commerce  
115 service system, and the limited scale of agricultural production and management were four  
116 major obstacles affecting farmers' willingness to participate in rural e-commerce poverty  
117 alleviation [13].

118

### 119 3. THE THEORETICAL MODEL

120

121 The dual difference model, also known as the Difference-In-Difference Model (DID model), is  
122 a quantitative analysis method that evaluates the net impact of a policy, a project, or a  
123 behavior on the target. A DID model for evaluating the impact of rural e-commerce poverty  
124 alleviation on farmers' income is

$$125 Y = \alpha + \beta T + \lambda P + \theta TP + \varepsilon \quad (1)$$

126 Y is the dependent variable, indicating the per capita net income of the farmers. And P is a  
127 dummy variable, indicating whether the affected households participate in the rural e-  
128 commerce poverty alleviation, that is, participation means P=1, no participation means P=0.  
129 T is a dummy variable, indicating that the affected farmers participate in rural e-commerce  
130 poverty alleviation, that is, T=0 means before participation and T=1 means after participation.  
131  $\varepsilon$  is a random disturbance item, which represents other un-measurable factors affecting the  
132 income of farmers.

133 For the treatment group farmers, P=1, the DID model can be simplified as:  $Y = \alpha + \beta T + \lambda + \theta T + \varepsilon$ .  
134 Then, the incomes of the treatment group farmers before and after the participation are

$$135 Y = \begin{cases} \alpha + \lambda + \varepsilon, T = 0 \\ \alpha + \beta + \lambda + \theta + \varepsilon, T = 1 \end{cases} \quad (2)$$

136 Furthermore, the average change in per capita income of the treatment group before and  
137 after the implementation of rural e-commerce poverty alleviation is

$$138 \text{Diff}_A = (\alpha + \beta + \lambda + \theta + \varepsilon) - (\alpha + \lambda + \varepsilon) = \beta + \theta \quad (3)$$

139 For natural group farmers,  $P=0$ , the DID model can be simplified to  $Y = \alpha + \beta T + \varepsilon_0$ . Then,  
 140 the income of the natural group farmers before and after the implementation is:

$$141 \quad Y = \begin{cases} \alpha + \varepsilon, T = 0 \\ \alpha + \beta + \varepsilon, T = 1 \end{cases} \quad (4)$$

142  
 143 Furthermore, the average change in per capita incomes of the natural group farmers before  
 144 and after the implementation of rural e-commerce poverty alleviation is

$$145 \quad \text{Diff}_B = (\alpha + \beta + \varepsilon) - (\alpha + \varepsilon) = \beta \quad (5)$$

146 Therefore, the net effect (net impact) of rural e-commerce poverty alleviation on the income  
 147 of participating farmers is

$$148 \quad \text{Diff} = \text{Diff}_A - \text{Diff}_B = (\beta + \theta) - \beta = \theta \quad (6)$$

149 That is, the parameter of WP in the model is a double difference estimation value, which  
 150 represents the net effect or net effect of rural e-commerce poverty alleviation on farmers'  
 151 income, and also represents the policy effect of rural e-commerce poverty alleviation.

#### 152 4. DATA SOURCE AND STATISTICAL DESCRIPTION OF THE BASIC 153 CHARACTERISTICS OF THE FARMERS INTERVIEWED

154 This section may be divided by subheadings. It should provide a concise and precise  
 155 description of the experimental results, their interpretation as well as the experimental  
 156 conclusions that can be drawn.

##### 157 4.1 The distribution of Data

158 The data used in this paper was from the household survey in Zhumadian area, where 214  
 159 questionnaires were completed, 14 unqualified questionnaires were removed, and the  
 160 remaining 200 questionnaires were valid, in which farmers of 136 questionnaires participated  
 161 in e-commerce poverty alleviation, accounting for 68%. There were farmers of 64  
 162 questionnaires not participating, accounting for 32%. In addition, 84 of the 200 households  
 163 surveyed were poor households, accounting for 42%. 116 households were out of poverty,  
 164 accounting for 58%. The specific distribution of the interviewed farmers is shown in Table 1.

165 Table 1. Distribution of the interviewed farmers

Distribution	Zhuanta township	Erlang township	Tandia town	Yusha town	Wagan town	Shaodia township	Liupen town
Participating farmers	31	16	25	37	27	0	0
Not- Participating farmers	13	4	8	11	9	14	5
total	44	20	33	48	36	14	5
The proportion	22%	20%	16.5%	24%	18%	7%	2.5%

171 In the Zhumadian area, the implementation of rural e-commerce poverty alleviation was  
 172 relatively late. Since 2016, the support policies for promoting the implementation of the rural  
 173 e-commerce poverty alleviation project have been intensively released. The poverty-stricken  
 174

175 counties, poverty-stricken townships and poor villages have been encouraged and  
 176 supported to implement rural e-commerce poverty alleviation, which initially achieved  
 177 significant poverty alleviation results. In addition, according to the actual situation of pre-  
 178 investigation in Songji Village in Xiping County in Zhumadian in early 2018, and the  
 179 availability and accuracy of farmers' income data, the time of year before the participation of  
 180 rural e-commerce poverty alleviation was selected in 2015, the time of year after  
 181 participation of rural e-commerce poverty alleviation was selected in 2017. It could  
 182 accurately measure the direction and influence degree of rural e-commerce poverty  
 183 alleviation on farmers' income.

#### 184 4.2 Statistical description of the characteristics of the farmers interviewed

185 The basic characteristics of the farmers mainly include age, gender, whether or not the head  
 186 of household, education level, total family population, non-agricultural labor ratio, and family  
 187 cultivated area. The statistical description of the characteristics of the interviewed farmers is  
 188 shown in Table 2.

189 **Table 2. Statistical description of the characteristics of the interviewed farmers**

190

Variable	Minimum	Maximum	Mean	Standard Deviation
Age	1	5	3.38	1.03
Gender	0	1	0.57	0.50
Whether or not the head of household	0	1	0.58	0.50
Education level	1	4	2.04	0.73
Total family population	1	11	3.62	1.68
Non-agricultural labor ratio	0	1	0.57	0.49
Family cultivated area	1	14	4	1.8

194 *Note: The classification of age of the interviewed farmer: 1.39 years old and below, 2.40-49 years old,*  
 195 *3.50-59, 4.60-69, 5.70 years old and above; gender: male 1, female 0; whether or not the*  
 196 *head of household: yes 1, no 0; educated level: 1. Not attended, 2. Elementary school, 3.*  
 197 *Junior high school, 4. High school, 5. College and above.*

198 **Table 3. Gender of the interviewed farmers and the distribution of “whether or not the head of household”**

199

Variable	the number of people	proportion (%)
Male	113	56.5%
Female	87	43.5%
Head of household	115	57.5%
Non-head of household	85	42.5%

202 **Table 4. Age of the interviewed farmers**

203

Age	39 years old and below	40-49 years old	50-59 years old	60-69 years old	70 years old and above
Number of people	9	32	58	77	24
Proportion (%)	4.5%	16%	29%	38.5%	12%

204

205  
206  
207

%)

---

**Table 5. Education level of the interviewed farmers**

Education level	Not attended	Elementary school	Junior high school	High school	College and above
Number of people	44	111	42	3	0
Proportion (%)	22%	55.5%	21%	1.5%	0

216  
217  
218  
219  
220  
221  
222  
223

It can be seen from the above table that the proportion of males and females in the surveyed households was 56.5% and 43.5% respectively, of which the proportion of household heads was 57.5%, the youngest was under 39 years old, the maximum age was over 70 years old, and the average age was 50-59. The number of interviewed households between the ages of 40 and 69 accounted for 83.5%, indicating that the survey covered all age levels, and could reflect the implementation of the poverty alleviation. The level of education of the interviewed farmers was generally low. The number of rural households who had not attended school and only attended primary school was 155, accounting for 77.5%, which was generally in line with the current rural population. The number of people was between 1 and 11, and the average number per household was 3-4. The average and standard deviation of non-agricultural labor ratio were 0.57 and 0.49 respectively, indicating that most of farmers in the survey area were more willing to go out or work locally in order to obtain higher wage income than agricultural income. The average cultivated land area of the interviewed households was 4 Mu.

224  
225  
226

**4.3 Satisfaction of the interviewed farmers participating in rural e-commerce poverty alleviation**

228  
229  
230  
231  
232  
233  
234  
235

According to Table 6, nearly 69.1% of the respondents indicated that they were very satisfied or satisfied with regard to raising the income level. In terms of the improvement of family living standards, 52.9% of the respondents indicated that they were very satisfied or satisfied. It can be seen that in the process of implementation, rural e-commerce poverty alleviation could indeed enrich the sources of income, optimize the income structure, increase household income, and at the same time significantly increase expenditures and improve living standards. In terms of overall satisfaction, 61.8% of the surveyed households expressed satisfied or very satisfied, and only 11.8% of the surveyed households expressed dissatisfied or very dissatisfied.

## 5. AN EMPIRICAL ANALYSIS OF THE IMPACT OF RURAL E-COMMERCE POVERTY ALLEVIATION ON FARMERS' INCOME

### 5.1 An Empirical Analysis of the Impact of Single Variable of E-commerce Poverty Alleviation on Farmers' Income

#### 5.1.1 Variable selection and descriptive statistics

In this paper, the impact of rural e-commerce poverty alleviation on the income of farmers was studied. The changes in the per capita net income before and after the implementation of rural e-commerce poverty alleviation were analyzed. At present, the income sources of rural households in Zhumadian area were mainly agricultural income obtained from agricultural production, wage income obtained by going out or working nearby, income from land transfer, capital purchase and so on, transfer income from national preferential policies. The wage income, property income, and transfer income were unified into non-agricultural income for the model significance test. Therefore, the per capita net income of the farmer for Y, the net income per capita agricultural operation for YN, and the net non-agricultural income for YF were respectively taken as the explanatory variables to analyze the net impact of rural e-commerce poverty alleviation on the income of participating farmers. According to the year for the surveyed farmers to participate in the rural e-commerce poverty alleviation mainly in 2016 and the accuracy of the farmers' past income records, the year of income of the households before and after the survey was selected as 2015 and 2017. It could more accurately measure the direction and impact of rural e-commerce poverty alleviation on farmers' income and income structure. Therefore, this paper used a total of 400 samples farmer income data in 2015 and 2017.

The statistical description of the main explanatory variables in this paper is shown in Table 7. The minimum value of Y, YN, and YF is 0 Yuan. The main reasons might be those interviewed farmers cannot be engaged in agricultural production or go out to work nearby due to their ages and serious illness. The maximum values of Y, YN, and YF were 13718.2 Yuan, 3823.3 Yuan, and 15800 Yuan. The average values of Y, YN, and YF were 6729.27 Yuan, 1441.22 Yuan, 5288.05 Yuan. The standard deviation was 4164.29 Yuan, 705.53 Yuan, and 3732.75 Yuan. The maximum value of YF was as high as 15,800 Yuan. The main reason might be that the interviewed farmer not only transferred the household contracted farmland to the special agricultural product planting base established by the e-commerce enterprise, but also obtained a stable land transfer fee and also got priority to work in the base. More family members were allowed to work nearby, go out to work, extend the time spent on work, and obtain higher income from work. Thereby substantially the non-agricultural income of farmers' families was increased.

**Table 7. Statistical description of the dependent variables**

<b>Dependent Variable</b>	<b>Minimum</b>	<b>Maximum</b>	<b>Mean</b>	<b>Standard Deviation</b>
the per capita net income of the farmer Y (yuan)	0	13718.2	6729.27	4164.29
the net income per capita agricultural operation YN (yuan)	0	3823.3	1441.22	705.53
the net non-agricultural income YF (yuan)	0	15800	5288.05	3732.75

283

284 **5.1.2 Model estimation results and explanation**

285

286 Table 8 shows that from the perspective of per capita net income before the implementation  
 287 of rural e-commerce poverty alleviation, the per capita net income of participating  
 288 households was 4181.83 Yuan, while the per capita net income of the non-participating  
 289 households was 3502.55 Yuan, the former was 679.28 Yuan more than the latter. The  
 290 income level was not much different. After the implementation of rural e-commerce poverty  
 291 alleviation, the per capita net income of participating households was 11,231.53 Yuan, and  
 292 the per capita net income of non-participating households was 4494.27 Yuan. The former  
 293 was 6278.26 Yuan more than the latter. The difference between the previous differences  
 294 was 5,067.98 Yuan. That is, DID value was 5,067.98 Yuan. After the implementation of rural  
 295 e-commerce poverty alleviation, the per capita net income of participating households  
 296 increased by 7047.70 Yuan than before the implementation, while the per-capita net income  
 297 of non-participating households increased slightly. After the implementation, the increase  
 298 was only 1441.72 Yuan before the implementation. It showed that the positive net impact of  
 299 rural e-commerce poverty alleviation on the per capita net income of farmers was 5607.98  
 300 Yuan.

301

302 From the perspective of net income per capita agricultural operation, before the  
 303 implementation of rural e-commerce poverty alleviation, the per capita agricultural operating  
 304 net income of participating households was 869.88 Yuan, while the non-participating  
 305 households were 773.23 Yuan, the difference between the two was 96.65 v, which showed  
 306 that between participating households and the non-participating households it was not  
 307 different much before the implementation. After the implementation of rural e-commerce  
 308 poverty alleviation, the per capita agricultural operating net income of participating  
 309 households was 2146.83 Yuan, while the non-participating households were 1318.83 Yuan,  
 310 the difference between participating households and the non-participating households was  
 311 828 Yuan. It can be seen that the participation of households and non-participating  
 312 households differed greatly after implementation. Compared with before the implementation,  
 313 the difference was 731.35 Yuan. That is, DID value is 731.35 Yuan. It indicated that the  
 314 positive net impact of rural e-commerce poverty alleviation on the per capita agricultural net  
 315 income of households was 731.35 Yuan.

316

317 From the perspective of per capita non-agricultural net income, after the implementation of  
 318 rural e-commerce poverty alleviation, the per capita agricultural operating net income of  
 319 participating households was 9084.69 Yuan, an increase of 5772.74 Yuan than that before  
 320 the implementation, showing that rural e-commerce poverty alleviation was involved. The  
 321 influence to per capita agricultural operating net income of farmers was very significant. The  
 322 per capita agricultural operating net income of non-participating households was 3,256.44  
 323 Yuan, which was only 896 Yuan more than before the implementation. The change was not  
 324 so much. The difference of added value of operating net income between the per capita  
 325 agriculture of participating farmers and non-participating farmers was 4,876.74 Yuan, which  
 326 indicated that the positive net impact of rural e-commerce poverty alleviation on the per  
 327 capita non-agricultural net income of farmers was 4,876.74 Yuan. Among them, the per  
 328 capita non-agricultural net income of participating farmers was 9084.69 Yuan, a net increase  
 329 of 5772.74 Yuan than that of before the implementation, with a growth rate of 174%.

330

331

332

**Table 8. Mean difference of income of farmers before and after participation**

The per capita net income of the farmer Y (Yuan)	Participating farmers	Non-participating farmers	Diff
2015	4181.83	3502.55	679.28
2017	11231.53	4944.27	6287.26

### **5.1.3 DID model estimation results**

The following is a significant test of the DID estimates in Table 9 using SPSS (20.0) software. The results are shown in Table 9.

**Table 9. Significance test results**

Variable	Coefficient	Y	YN	YF
C (cons)	$\alpha$	3502.545***	773.233***	2729.313***
T	$\beta$	679.289	96.652	582.637
P	$\lambda$	1441.724***	545.597***	896.127**
TP	$\theta$	5607.967***	731.351***	4876.615***
R <sup>2</sup>		0.617	0.600	0.541

341 Note: \*, \*\*, and \*\*\* indicate significant levels at 10%, 5%, and 1% respectively.

342 Table 9 shows the DID coefficients of Y, YN, and YF are 5607.967, 731.351, and 4876.615  
343 respectively. And all of them are significant at the 1% level. The coefficient  $\lambda$  of P is  
344 1441.724, 545.597, and 896.127 respectively. And the former two are significant at the 1%  
345 level, and the latter is significant at the 5% level. These demonstrate that rural e-commerce  
346 poverty alleviation has a significant positive impact on farmers' net income, agricultural net  
347 income, and non-agricultural net income. That is, after the implementation of rural e-  
348 commerce poverty alleviation, agricultural operating income, and non-agricultural income  
349 have all increased significantly between the treatment group and the natural group income.  
350

## **5.2 An Empirical Analysis of the Impact of Other Control Variables on Farmers' Income**

### **5.2.1 Model design and variable selection**

356 In the above model, the effects of individual and family factors on the income of farmers are  
357 neglected. In order to increase the accuracy of this study, a fixed-effects model is used to  
358 study the evidence, as shown in equation (7):  
359

$$Y_{fs} = \alpha + \beta T_s + \lambda P_f + \theta T_s P_f + X_{fs} + \varepsilon_{fs} \quad (7)$$

360  
361

362 Where  $f$  is the farmer household,  $s$  is the period.  $Y_{fs}$  is the per capita income of the farmer  $f$   
 363 during the  $s$  period.  $P_f$  indicates whether the farmer  $f$  participates in the dummy amount of  
 364 the rural e-commerce poverty alleviation. That is, participation in means  $P_f=1$ , not  
 365 participating in means  $P_f=0$ .  $T_s$  is a dummy variable about farmers participate in the dummy  
 366 quantity before and after rural e-commerce poverty alleviation. That is, before participation  
 367 means  $T_s = 0$ , and after participation  $T_s = 1$ .  $X_{fs}$  is a set of observable variables that affect the  
 368 income of farmers, including the age, gender, whether or not the head of household,  
 369 education level, the total number of family members, the proportion of non-agricultural labor,  
 370 and the area of cultivated land.  $\varepsilon_{fs}$  is another influencing factor that affects the income of  
 371 farmers but is unobservable.

372  
 373 The independent variables include the three dummy variables ( $T$ ,  $P$ ,  $TP$ ), the personal  
 374 factors of the farmers and the family factors. The personal factors include the age, gender,  
 375 whether or not the head of household, education level. Family factors include the total  
 376 number of family members, the proportion of non-agricultural labor, and the area of  
 377 cultivated land. Assume that  $X_1$  is the age of the farmer,  $X_2$  is the gender,  $X_3$  is “whether  
 378 or not the head of household”,  $X_4$  is the education level,  $X_5$  is the total number of family  
 379 members,  $X_6$  is the non-agricultural labor ratio, and  $X_7$  is the family cultivated land ( $\mu$ ).

### 381 **5.2.2 Model results and interpretation analysis**

382  
 383 Using SPSS 20.0 software and fixed effect mode  $Y_{fs} = \alpha + \beta T_s + \lambda P_f + \theta T_s P_f + X_{fs} + \varepsilon_{fs}$   
 384 (7), regression analysis was performed on the income of all surveyed households. The  
 385 results are shown in the following table:

386  
 387 **Table 10. Model estimation results for the main control variables**

Variables	Y	Y <sub>N</sub>	Y <sub>F</sub>
age $X_1$	-6.623	2.781	-9.044
gender $X_2$	155.459	122.731	32.728
whether or not the head of household $X_3$	-237.182	-71.437	-165.745
education level $X_4$	506.509**	57.708	448.800**
the total number of family members $X_5$	1135.696***	19.374	1116.322***
the non-agricultural labor ratio $X_6$	9986.067***	1174.862***	8811.205***
the family cultivated land ( $\mu$ ) $X_7$	94.371	71.706***	22.665
C (cons)	-2296.118*	316.302	-2612.419**
R2	0.524	0.256	0.526

388  
 389 Note: \*, \*\*, and \*\*\* indicate significant levels at 10%, 5%, and 1%, respectively.

390 Table 10 shows that the age of farmers has a negative impact on the per capita net income  
 391 of farmers and the net non-agricultural income per capita, but they are not significant. The  
 392 age has a positive impact on the net income of per capita agricultural operations, and it is  
 393 not significant. “whether or not the head of household” has a negative impact on the per  
 394 capita net income of farmers, net income per capita agricultural operation, and per capita  
 395 non-agricultural net income, but and they are not significant. The education level has a  
 396 significant positive impact on the per capita net income and per capita non-agricultural net  
 397 income of farmers at the level of 5%. The total number of family members has a significant  
 398 positive impact on the per capita net income, and the net non-agricultural income per capita  
 399 at the level of 1%. The non-agricultural labor ratio has a significant positive impact on the  
 400 farmer's per capita net income, the per capita farmer's operating net income, and the per

401 capita non-agricultural net income at the level of 1%. The family cultivated land area is  
 402 significant for per capita agriculture at the level of 1%.

403

### 404 **5.3. The Impact of Rural E-commerce Poverty Alleviation on Farmers' Income** 405 **Structure**

406

407 Table 11 shows that the per capita agricultural net income, per capita net income, and per  
 408 capita net income of per capita farmers accounted for 20.80%, 77.49%, and 1.71%  
 409 respectively after the implementation of poverty alleviation in rural e-commerce. While the  
 410 ratios were 22.08%, 75.81%, 2.11% respectively before the implementation of poverty  
 411 alleviation in rural e-commerce. Per capita agricultural operating net income, per capita  
 412 property net income decreased by 1.28 and 0.4 percent, and per capita wage net income  
 413 increased by 1.68 percent. Those showed that the change of family income structure of non-  
 414 participating households was not significant in the period of the implementation of rural e-  
 415 commerce poverty alleviation. For the participating households, the per capita wage net  
 416 income and per capita property net income accounted for 73.10% and 0.22% before the  
 417 implementation of rural e-commerce poverty alleviation, and 76.97%, and 3.92% after the  
 418 implementation of rural e-commerce poverty alleviation. It was an increase of 3.87 percent  
 419 and 3.7 percent respectively. Per capita agricultural operating net income accounted for  
 420 26.68% and 19.11% respectively. It was a decrease of 7.57 percent. The household income  
 421 structure of participating households had changed significantly comparing with that before  
 422 and after the implementation of rural e-commerce poverty alleviation. And the income  
 423 sources were more diverse. The ability of famers to continue to increase revenue had  
 424 increased significantly.

425

426 **Table 11. Changes in income structure of farmers**

427

Income structure	Participating farmers		Non-participating farmers	
The net income per capita agricultural operation (Yuan)	22.08%	20.80%	26.68%	19.11%
The net income per capita wage (Yuan)	75.81%	77.49%	73.10%	76.97%
Per capita property net income (Yuan)	2.11%	1.71%	0.22%	3.92%
Sum	100%	100%	100%	100%

428

429

430

## 429 **6. CONCLUSION**

431

432

433

434

435

436

431 The rural e-commerce poverty alleviation has a significant effect on farmers' income. The  
 432 rural e-commerce poverty alleviation can greatly increase the agricultural operation income  
 433 and non-agricultural income of the participating farmers, so as to increase the total income of  
 434 the participating households. Thus it could help the participating farmers to increase income  
 435 and get rid of poverty.

437

438

439

440

441

442

443

444

437 The rural e-commerce poverty alleviation has long-term effects on farmers' income. From the  
 438 field research, the non-agricultural income of farmers mainly included wage income, land  
 439 transfer fees, dividends for enterprises, and so on. The farmers achieved stable employment  
 440 by participating in offline production activities of local network operators. They sign land  
 441 transfer agreements with agricultural product e-commerce enterprises, and obtain stable  
 442 annual transfer costs. They applied for poverty alleviation microfinance and invested in local  
 443 poverty alleviation e-commerce enterprises to get a fixed annual corporate dividend. Poverty  
 444 township government and local leading e-commerce enterprises signed cooperation

445 agreements to guide them to sign acquisition contracts with poor farmers, which promised to  
446 buy agricultural products produced by poor farmers at higher than market prices. It helped  
447 poor farmers to improve agricultural operating income.

448  
449 The rural e-commerce poverty alleviation can optimize the household income structure of  
450 farmers in the short term. It can increase the wage income and property income of  
451 participating farmers by increasing the opportunities for nearby employment, extending the  
452 time of working outside the home, accelerating the transfer of contracted farmland, and  
453 capital stocks to increase the wage income and property income of participating farmers. It  
454 reduced agricultural income significantly to expand the income source of farmers and  
455 optimize the family income structure.
