

1 **ENFORCEMENT OF ACCESS TO EFFECTIVE TECHNICAL SUPPORT**
2 **SERVICES IN THE KENYAN SOLAR ENERGY SYSTEM**

3
4 **ABSTRACT**

5 It is clear that energy is the prime mover of development cutting across industrialisation,
6 manufacturing and residential consumption. Recently, Kenya, being ranked high among the
7 most developed countries in Africa, has mapped way for embracement of renewable energy
8 technology with increasing debate on sustainable development and environmental issues
9 associated with fossil fuels, as the prime energy sources.

10 This paper aims at investigating the leading role of access to viable technical support services
11 in mitigating solar energy adoption challenges.

12 This paper will focus on challenges faced by small and medium sized consumers in search for
13 technical advice and support prior to purchase, during installation and after purchase and
14 installation stages. The research will conduct survey via questionnaires, analyze data
15 obtained, identify technical support factors in order of priority and give adaptable
16 recommendation for the state in ensuring that solar projects are sustainable and that
17 customers find value for their money.

18
19 **KEY WORDS:**

20 Renewable energy

21 Solar energy

22 Technical support services

23
24 **INTRODUCTION**

25 Solar is the centre of renewable energy as all other forms directly or indirectly rely on it. This
26 outlines its great potential as a source of energy, hence why its adoption should be seriously
27 considered. Of the key challenges of solar reliability is the low efficiency and the low

28 potential of latitudes. However, Kenya, lying along this region has a very wide-scale
29 potential since daily solar irradiance is almost constant all year round. There is a unique
30 nature of regions along the equator to maximize on solar energy as observed by (Kabir, Kim,
31 & Szulejko, 2017).

32 Adoption and development of solar energy in Kenya is greatly challenged by non-standard
33 solutions and service providers. Customers are not able to get value for their money thus
34 losing trust in this particular technology.

35 Lampinen (2018) explained that technical quality (value and budget) in external engineering
36 support depends on three major factors referred to as the PPT (people, process and
37 technology). This paper will focus on the first two, in regard to third-party inspection and
38 verification, as follows:

- 39 1. People: quality technical work requires technically qualified persons. The
40 government ought to strengthen the specific qualification and credentials for people
41 engaging in solar works that clients must look at before engagements. The
42 government can source for such experts and deploy them to county levels for easy
43 accessibility. Serious measures must be taken against violators.
- 44 2. Process: come up with well designed execution framework that will focus on client
45 diversities. The latter should foster excellent technical communication between the
46 client and service provider. Service providers must understand that solar projects are
47 basically outsourced services by clients, who are prone to both technical and
48 operational difficulties and other performance related problems. They must then have
49 customer resolution processes at hand.

50 With public education on solar energy, embracing the technology has not been a big
51 challenge recently. Firms have also come up to finance solar energy adoption. In 2018, the
52 Kenyan government in collaboration with World Bank, KPLC and REA deployed county
53 renewable energy officers to 14 counties in attempt to balance access to affordable energy
54 across the country. In 2018, electricity prices shot up and later on, VAT was introduced on
55 petroleum products. Recently, prices have continued to shoot as announced by Energy
56 Regulatory Commission in April 2019. As a result, cost of life has increased considerably and
57 it is evident that the trend will not reverse in the future; instead, it will get worse.

58 Consequently, it is the high time scholars and specialists dug deeper into the issue to get a
59 reliever solution.

60 Studies to reveal solar energy drawbacks in africa revolve around four factors, with Kenya
61 not exceptional. Affordability and access to finance support was lanked the first challenge.
62 Other challenges outlined by studies are enabling environment, technical support services and
63 awareness (Da Silva , 2016). However, with several institutions understanding solar projects
64 and offering required initial support, it seems the latter is more less a big challenge. The solar
65 industry has become very competitve but one thing supplier lack in common, is proper
66 technical support services thus lowering interest and confidence of customers on the
67 technology.

68 The government must strategise on how to provide customer advisory, both technical and
69 financial, prior to puchasing, educate the society on project handling and usage as well as
70 engage them in after sale services. Customers want to see value for their money which could
71 be through personal investment or taxes paid. The latter has not been the case, with suppliers
72 competing to win tenders and there after turning their backs on clients once they receive the
73 payment. No one cares to find out how the projects are fairing. Others never respond to client
74 problems arising there after. As a result, very needy clients end up making a repeat purchase
75 from a second supplier while others completetly abandon the concept and emback on their
76 earlier methods. If only the industry players came up with a management and monitoring
77 policy where supplier are forced to provide quality technical support services, the above
78 menace would be completely handled. The latter has proved possible in other fields such as
79 the health sector. Specialists must be accountable for their engagements. The aseessment in
80 this paper matches that observed by (Kabir, Kim, & Szulejko, 2017) in a case study in
81 Bangladesh whereby the author argued that stake holders need to strengthen after-sale
82 services for ensured sustainability.

83

84 **RESEARCH DESIGN**

85 Due to the diversity of our government and the constitution, the research should be effective
86 in terms of respondent randomness and time if the study concentrates on a single county,
87 away from the most developed counties. It must be a county where a better half of its

88 population lacks access to adequate grid power. This will be a representative county for this
89 case.

90 The researcher should conduct general public awareness training through methods that will
91 be considered available and most effective such as public meetings. It will then invite
92 respondents from a chosen demography who will provide reliable feedback (either verbally or
93 by filling the forms and returning them). Most preferred are individuals aged between 18 and
94 70 years, mostly targeting the educated and those with knowledge of the new technology
95 developments worldwide. Both male and female respondents would be considered and
96 randomly chosen.

97

98 The researcher may choose to use survey questionnaires on the representative county, on
99 technical support services in terms of awareness, availability, accessibility, competency,
100 affordability, accountability, reliability, appropriateness, continuity, acceptability, timeliness,
101 accuracy, attentiveness, comprehensiveness and responsiveness. However, this paper will
102 focus more on the 4 most essential factors of the latter.

103

104 **RESULTS/ FINDINGS**

105 **FACTOR CONSIDERED**

106 **1. Awareness**

107 The general citizens of underserved regions are less aware of new energy technologies and
108 have very limited engagement capacity in renewable energy and other off-grid electrification
109 programs. Around 35 per cent of the people I engaged with are aware on solar energy
110 existence but do not have much knowledge of how it works. 80 per cent of the 35 per cent
111 above are in the youth bracket with less than 20 per cent being women. Extensive citizen
112 engagement and capacity building is required. This could be through respective county
113 planning or via consultancy plans so as to help identify skills, resources and necessary
114 coordination to meet the growing energy demand.

115 **2. Availability**

116 Among the technologies, solar energy was the most familiar. Despite some citizens being
117 aware of renewable energy technologies, they still faced a major challenge of investors and
118 technical experts being unavailable for reach and consultation.

119 Renewable energy technology experts were found to be concentrated within certain areas and
120 more sore counties/ regions within Nairobi, Rift valley and the lake regions. These are the
121 same regions with easy access to grid power. However, regions that are more desperate for
122 power and those in underserved counties were less covered by private investors more sore
123 due to low infrastructure developments, long travel distances and insecurity issues.

124

125 **3. Accessibility**

126 Among the communities with existing solar energy projects, a common problem was
127 accessibility of technology specialists to assist them whenever the projects had challenges.
128 Some knew contact people who however, were not able to render their services in good time.
129 As a result, the projects took long to get maintenance, thus sometimes completely destroying
130 some components such as pumps and batteries. Consequently, this killed customers' trust in
131 the technology.

132 **4. Competency**

133 The few technical assistance specialists available were averagely competent as they managed
134 to sort most of small and medium challenges effectively. However, high level problems such
135 as solar water pumping solutions remained a challenge to many.

136 **5. Affordability**

137 After sale customer services were very high. This could be possibly by providers setting their
138 services cost very high thus exploiting the clients, instead of maturing the technology.

139

140 **In conclusion**, it is evident that lack of above factors have caused technical failure, reduced
141 customer trust in the technology as well as scared off of potential customers and investors.

142

143 **DISCUSSION**

144 **1. Awareness**

145 Citizens have the right to know of any advances in technologies in energy and expect to be
146 presented with clear and timely information about the advantages and disadvantages of such
147 technologies.

148 **2. Availability**

149 Citizens have the right to know how to access energy technology advances. This requires the
150 service providers to adequately interact with the clients to share their concerns, challenges
151 and any feedback on the technology or any services provided to them. Services providers
152 should be readily available to offer customer guidance on how to achieve maximum benefit
153 from their solutions and technologies. Operations and maintenance issues must be adequately
154 addressed.

155 To address the latter, it is advisable for organisations and suppliers to do skill training to part
156 of the community members as part of Customer Social Responsibility. Those already with
157 such skills and coming from such communities could also be hired to encourage development
158 of these technologies as well as offer consultancy services on the same as well as maintaining
159 existing systems.

160

161 **3. Accessibility**

162 A good portion of energy-desperate communities have expressed their interest in solar energy
163 technologies and their willingness to accept and support the innovation. The administration is
164 much willing and supportive of the idea. They are willing to pay for effective products and
165 services and thus require both pre-sales and after-sale services to be readily available and
166 accessible.

167

168 **4. Competency**

169 With quite adequate familiarisation with solar lighting solutions, competence in solving
170 related challenges is averagely high. However, we need to equally invest in solar water and
171 energy expertise. This could be achieved via specialised partnership and training with key
172 stakeholders in the sector such as water and energy appreciation courses offered by Davis and
173 Shirtliff, a key player in Kenya in water and energy solutions.

174

175 **5. Affordability**

176 There has a common trend where after sale expenses are considerably high when offered by a
177 party different from the initial product supply party. This is commonly because each party
178 wants to reap maximally from their services. This is the opposite when the initial product
179 supplier has a maintenance contract for the product supplied or when the supplier is
180 responsible for after sale training either to the product owner or in form of CSR whereby
181 operation and maintenance skills are passed to the community members.

182

183

184

185 **CONCLUSION AND RECOMMENDATION**

186 It is recommended for the government to establish enforcement and monitoring unit that
187 ensures organisation and individuals provide effective coordination for their products from
188 pre-purchase to after sale developments. This would accelerate absorption of solar energy and
189 present an opportunity for large scale solutions such as solar minigrids, solar water pumping,
190 solar water purification as well as solar water treatment technologies. The latter stand great
191 opportunities in underserved countries such as those along the coastal region and Arid and
192 semi-arid areas that have good basis of underground water and saline waters.

205 Table 1: Survey questionnaire

206 Section I: Introduction

207 The survey purposes at understanding technical customer support motivation, benefits and
208 challenges perceived by individuals/ bodies regarding adoption of solar energy systems in
209 Kenya. An estimate of 1000 surveys was targeted. Allowed responses were physical and
210 electronic modes only. All responses were checked to ensure there were no duplicates.

211 **FACTORS CONSIDERED IN THIS PAPER**

- 212 1. Awareness
- 213 2. Availability
- 214 3. Accessibility
- 215 4. Competency
- 216 5. Affordability

217 Section II: Demography-respondent background information

	Questions	Options	Noes/Comments
1.1	Name of the Respondent		
1.2	District name		
1.3	Respondent's Address and Contact Details	Mobile: Email (if any): Postal Address:	
1.4	Locality	1. Urban 2. Rural	
1.5	Type of Respondent	1. On-grid Consumer	

		2. Off-grid Consumer	
1.6	Category of Respondent	<ol style="list-style-type: none"> 1. Domestic 2. Commercial 3. Agriculture 4. Industrial 5. Any other, please specify__ 	
1.7	Respondent's Gender	<ol style="list-style-type: none"> 1. Male 2. Female 	
1.8	Literacy level of the respondent	<ol style="list-style-type: none"> 1. Uneducated 2. High school 3. Below graduation 4. Well qualified (Diploma, Masters, etc.) 	
1.9	Monthly income Ksh.	<ol style="list-style-type: none"> 1. Between 0- 10,000 2. Up to – 25,000 3. Up to – 50,000 4. 3. Up to – 100,000 5. 3. Up to – 200,000 6. Above 200,000 	
1.10	Occupation	<ol style="list-style-type: none"> 1. Unemployed 2. Self-employed 3. Government service
