

## Original Research Article

### DEVELOPMENT OF A SINGLE WHEEL TEST RIG FOR MEASURING MOTION RESISTANCE

#### ABSTRACT

Research on soil-wheel interaction is sine qua non in studies of motion resistance. ~~This however~~ This, however, requires test rig facility for controlled experiment. However, such facility is non-existent presently in Nigeria. A single wheel ~~Test Rig- test rig~~ facility was developed at FUTA. It consists of a soil bin, tool carriage, single wheel tester, trolley and drive system. The indoor soil bin facility was equipped with a soil bin which dimension was 9.76 m length x 1.98 m width x 0.92 m height. The wall of the soil bin was constructed with wood. The woods are clad with bin wall (angle iron) for better reinforcement, rigidity and effective ~~behaviour-~~ behavior of bin walls in service.

A single-wheel tester facility was utilized to investigate the effect of tire inflation pressure and vertical load on motion resistance of wheel. Two narrow wheels of 90/10-10 in width, IRC MB90 tire was used as the tester wheel on clay soil and was installed on a carriage traversing the length of soil bin. Two inflation pressures of 274 kPa and 380 kPa and four levels of vertical load applied on wheel (i.e. 15, 20, 30, and 40 kg) ~~was- were~~ examined at two different soil conditions (8% and 10% moisture content). ~~The Both~~ soil leveling and compaction roller were mounted on the carriage ~~was used~~ to achieve a certain soil compaction, before it is processed by the active body or performing various experiments with the tire test wheel. When the carriage is towed by the means of the cable, the wheel rotates due to the force on the cable. Towing cable is connected to the carriage by the means of a hitch hook, allowing the measurement of the towing force needed to displace the carriage. A control panel is used for the power supply of the two electric reducing motors. The data obtained ~~will be- analysed~~ analyzed using graphical method and statistical inherent analysis to get the significant effect of the factors with the response using ANOVA using statistical package for social sciences (SPSS 16). Exponential regression was obtained for the two wheels to check for linearity at different moisture content,  $R^2$  value for test wheel 1 with inflation pressure of 270 kPa at 8% moisture content was 0.9974 while that of inflation pressure of 380 kPa at 10% moisture content was 0.9952; also for test wheel two (2)  $R^2$  value was 0.9977 and 0.9914 at moisture content of 8% and 10% respectively, this shows for test wheel 1 with inflation pressure of 270 kPa at 8% moisture content showed more motion resistance compared to motion resistance of test wheel 1 at inflation pressure of 380 kPa and 10% moisture content, while for test wheel 2 with inflation pressure of 270 kPa showed low motion resistance at 8% motion content. In general, at constant level of soil compaction, the motion resistance ~~-(MR)~~ was ~~found to-~~ increased within the increase in vertical load, and in all inflation pressures, the effect of vertical load seems to be similar. Figure 5 – Figure 6 showed the ~~comparism-~~ comparison between ~~Motion resistance~~ ~~-(MR)~~ for the two test wheel as the vertical load and inflation pressure increases. Design Expert software was used to establish and validate a model based on how the experiment was ~~designed,~~ designed; the model established shows the coefficient determination ( $R^2$ ) of 0.9822 and the validation shows  $R^2$  value of 0.9727.

Comment [FS1]: Need to be changed, please

Comment [FS2]: Where?

Comment [FS3]: What does FUTA stands for?

Comment [FS4]: Need to be changed

Comment [FS5]: This could be moved to the Method section.

Comment [FS6]: What is the name of this method?

Comment [FS7]: Do you mean moisture?

44 The contact area for all tests was in the range of 309-330 cm<sup>2</sup>, average contact pressure  
45 increased nearly linearly with increase in vertical load and increase in inflation pressure. A  
46 single wheel test rig has been developed to study motion resistance of narrow wheels. The effect  
47 of different inflation pressures and vertical loads on the motion resistance of the narrow wheels  
48 has been investigated under different moisture content (8% and 10%). Data to assist in the  
49 development of simple, low cost and easy to maintain agricultural machines with narrow  
50 pneumatic wheel as traction members have been provided in terms of motion resistance and  
51 motion resistance ratios.

Comment [FS8]: Seems redundant

52 **Keywords:** Single wheel, test rig, Soil bin, motion resistance, vertical load, inflation pressure  
53 and moisture content.

## 54 1. INTRODUCTION

55 Field machines contribute a major portion of the total cost of crop production. The proper  
56 operation is essential for any system to be reasonably profitable. The machines and equipment  
57 used for operations make use of wheels and they are used on our farms. They make impact on  
58 the soil; then there is the need to measure motion resistance and its effect on soil is essential.

Comment [FS9]: Not a proper words

59 Zoz and Grisso (2003) reported that tractive ability of tractor is normally affected by soil  
60 reactions against the front and rear wheels. In the tractive performance of off- road vehicles,  
61 rolling resistance is a major factor in the determination of the drawbar pull of agricultural  
62 vehicles. Motion resistance is defined as the force opposing the motion of a free rolling wheel in  
63 contact with a surface. Motion resistance also refers to the resistance to motion of a wheel  
64 caused by the absorption of energy in the contacting surfaces of the wheel and the soil upon  
65 which the wheel rolls (Plackett, 1985; Macmillan, 2002). Therefore, simple and low-cost  
66 appropriate machines will help to increase the agricultural productivity of the agricultural  
67 ~~mechanisation~~mechanization development in developing countries. This is a key solution to  
68 increased agricultural productivity and economic survival (Akande *et al.*, 2008).

Comment [FS10]: Need a reference

69 The ~~specific~~ objectives of ~~these~~ this research is to design and fabricate a single wheel test rig to  
70 measure motion resistance of towed wheels in an indoor soil bin; evaluate the performance of  
71 the test rig under different soil moisture content; and establish and validate models to predict  
72 motion resistance for single towed wheels. The soil bin designed by Siemens and Weber (1964),  
73 Stafford (1979), Durant *et al.* (1980), Godwin *et al.* (1980), and Onwualu and Watts (1989) are  
74 some examples of small-scale soil bin. Researchers have been using soil bins to investigate the  
75 phenomena of soil-traction and soil compaction. Raheman and Singh (2002) studied the effect  
76 of steering forces on a driven tractor wheel in a soil bin. Canillas and Salokhe (2002) developed  
77 a decision support system to predict soil compaction based on a soil bin research. Carmen  
78 (2002) evaluated the degree of compaction caused by a towed wheel in a soil bin. Others ~~such as~~  
79 (~~Watyotha et al., 2001; Hendriadi and Salokhe, 2002~~) utilized a soil bin to gain a better  
80 understanding in Cage wheel design to improve the traction of the cage wheel.

## 81 2. Test Rig Facility

82 The location of this study is located in the soil Dynamics laboratory of the Department of  
83 Agricultural and Environmental Engineering, Federal University of Technology, Akure. A soil  
84 bin is required for this study, an existing soil bin was extended from its initial dimensions of  
85 5.49 m length x 1.98 m width x 0.92 m height; and after extension it was 9.76 m length x 1.98 m

86 width x 0.92 m Other features of the equipment are: an electric drive system, trolley, carriage  
87 which houses the test rig, a selected soil type and narrow wheels of different sizes and torque  
88 meters for the measurement of drought force and torques. The load shall be measure using  
89 weighing balance to get the vertical loading on the wheel. Preparation of soil was done by soil  
90 processing roller guided by the use of recording soil penetrometer to get the soil condition  
91 (moisture content and bulk density).

Comment [FS11]: Please add more description and details to this section. Also, please add pictures.

## 92 2.7 Design Considerations

93 Design considerations for the single wheel test rig include;

- 94 i. Power requirement: Two electric motors will be used for the test rig; one to move the  
95 carriage and the other to rotate the wheel.
- 96 ii. Sizes of wheels to be tested: tyre sizes ranges from 5.0 x 12 and 5.5 x 13 of rim sizes  
97 which are used for the calculation of the minimum and maximum width of the wheel.
- 98 iii. Location of the test rig facility: the test rig facility will be located in the Soil Tillage  
99 dynamics Research Laboratory of the Department of Agricultural Engineering of the  
100 Federal University of Technology, Akure.
- 101 iv. Type of soil: the soil was gotten from Federal university of Technology, Akure, STEP-B  
102 site and analyzed to get the class of soil; the soil was clay soil.
- 103 v. Soil processing device: Soil Processing device include frame and weigh pan.
- 104 vi. Control measurement
- 105 vii. Safety: The machine was design to be safe to man and its environment by avoiding sharp  
106 edges.

Comment [FS12]: Rewording

## 107 2.2 Test rig development

108 The test rig consists of a rigid frame, the soil bin, the carriage, on which the active part for  
109 soil working is mounted, the wheel with tire; at the end of laboratory test rig a winch is fixed,  
110 which is for trolley carriage with the cable. An electric motor, pulley, shaft, bearing and belt are  
111 used for transmission of motion to drive the trolley; the trolley was driven by the cable, thus  
112 towing the cart. The ends of the drive are attached to the carriage by the means of the hitches.  
113 The carriage is also fitted with an electric motor and a gear transmission in order to drive the tire  
114 wheel. The working depth of the wheel can be adjusted by the means of the hydraulic fork,  
115 dependent on the vertical load and it is used to adjust the vertical position of the tire wheel.

Comment [FS13]: Adding pictures will help the reader better

## 116 Characteristics of the Soil to be studied

### 117 Sample Location

118 The sample of soil used in the indoor soil bin facility for testing was taken at the  
119 Teaching and Research Farm of the Agricultural and Environmental Engineering (AGE),  
120 Federal University of Technology, Akure (FUTA) for soil-analyses. The area has a general  
121 elevation of between 300 and 700 metres/meters above the mean sea level and means annual  
122 rainfall between 1300 mm to 1500 mm.

### 123 Sampling Method

124 The sampling method used in collecting the sample is the pit sampling. It is done by  
125 using farm tools (which include: digger, spade, cutlass and hand trowel) to collect the soil  
126 sample through the soil profile.

127 During the collection of this sample, the outermost layer of the soil (about depth of 5cm)  
128 was removed. Then, the soil is dug in profiles such that five profiles of soil were collected. The  
129 depth of each profile is 10cm as shown in table 1 below.

### 130 Characteristics of the wheels to be studied

131 Brand - IRC (INOUE RUBBER COMPANY); Front/Rear - Front, rear

132 Tire size - 90/90-10; Bias/Radial - Bias Ply; Rim size - 10

133 Tube/Tubeless - Tubeless

### 134 Experimental setup

135 The soil leveling and compaction roller mounted on the carriage was used to achieve a  
136 certain soil **compaction**, before it is processed by the active body or performing various  
137 experiments with the tire test wheel. When the carriage is towed by the means of the **cable**, the  
138 wheel rotates due to the force on the cable. Towing cable is connected to the carriage by the  
139 means of a hitch hook, allowing the measurement of the towing force needed to displace the  
140 carriage. A control panel is used for the power supply of the two electric reducing motors. The  
141 dynamic braking principle is used in order to stop the carriage at the end of travel with the use of  
142 a forward contactor. Switches on the control panel allow the selection of the electric motor (the  
143 carriage towing motor or the tire wheel driving motor), as well as its forward or reverse motion.  
144 The soil moisture content was obtained experimentally, the inflation pressure was achieved  
145 using pressure gauge, vertical loading with the weighing scale, the rolling resistance (towing  
146 force) and torque were calculated.

Comment [FS14]: Please describe it

Comment [FS15]: What do you mean by that?

### 147 Test variables

148 For this study on the motion resistance (towing force) of pneumatic wheels; two wheels were  
149 used of the same overall wheel diameter 510 mm but different design at four levels of added  
150 loads, two levels of **tyre** inflation pressures at 274 kPa (40 psi) and 380 kPa (55 psi) and at two  
151 different soil conditions (8% and 10% moisture content).

### 152 Dynamic loads

153 The dynamic loads which is synonymous to the axle or vertical loads ~~are-is~~ first measured in the  
154 laboratory comprise the weight of the test rig and the test wheel. Four levels of added dynamic  
155 loads (dead weights) of 98.1 N (10 kg), 147.15 196.2 N (20 kg), 294.3 N (30 kg) and 392.4 N  
156 (40 kg).

### 157 Effect of Vertical Load and Inflation Pressure on Motion Resistance of the Wheels

158 The vertical loading and wheel inflation pressure was varied to evaluate its effect on the  
159 motion resistance of the **wheel**.

Comment [FS16]: You should add more details

### 160 Effect of Vertical Load and Inflation Pressure on Contact Area

161 The vertical loading of 150 N, 200N, 300 N, 400 N and wheel inflation pressure of 274  
 162 kPa and 380 kPa was varied for every experiment to evaluate its effect on the contact area. The  
 163 contact area was measure by the use of A4 paper placed on the path of the wheel to calculate the  
 164 contact area of the wheel with the soil.

165 **Data Analysis**

166 The data obtained will be ~~analysed~~analyzed using graphical method and statistical  
 167 inherent analysis to get the significant effect of the factors with the response using ANOVA  
 168 using statistical package for social sciences (SPSS 16) to test whether there is significant  
 169 difference between the means of the measured motion resistance on the test surfaces and the two  
 170 pneumatic wheels of the same sizes. Design expert 9 would be used to establish a two level  
 171 factorial model and validated using the Excel 10.

172 **3. Results and Discussion**

173 **Component Design and Features of the Single Wheel Test Rig**

174 The soil bin facility consists of (i) The bin (ii) tool carriage (iii) Single wheel tester (iv)  
 175 Trolley (v) drive. The bin is a soil box with rails on the top on which the carriage rides. The  
 176 indoor soil bin facility was equipped with a soil bin which dimension was 9.76 m length x 1.98  
 177 m width x 0.92 m height, respectively. The walls of the soil bin were constructed with wood.  
 178 The woods are clad with bin wall (angle iron) for better reinforcement, rigidity and effective  
 179 behavior of bin walls in service. Soil fitting refers to the process used to prepare the bin soils to  
 180 provide desired soil conditions. The soil fitting sequence usually begins with the leveling of the  
 181 soil surface to refill irregularities, pits and furrows and to make sure there is an even distribution  
 182 of soil side to side and end to end of the bin, also the roller for compacting the soil to have  
 183 different bulk density.

Comment [FS17]: Please explain these densities

239 **Development of a Model for measuring Motion Resistance at 8% Moisture Content**

240 The data ~~gotten~~ recorded from the experiment carried where separated into two; and this  
241 was done in the ratio of 80% of the data to establish the model while 20% to validate the model.  
242 In this study, BBD was used for response surface optimization with three process variables  
243 (inflation pressure, vertical load, and wheel speed) at three levels. The design points fall within a  
244 safe operating limit, within the nominal high and low levels, as BBD does not contain any points  
245 at the vertices of the cubic region. Two different tests, namely, sequential model sum of squares  
246 and model summary statistic were performed to check the adequacy of the models generated  
247 from the obtained data.

Comment [FS18]: Two what?

Comment [FS19]: What is BBD?

Comment [FS20]: Need to rewording these

248 Predictive model for motion resistance:

249  $MR = -0.011302 - 0.082711IP - 0.10229VL + 93.45734WS$   $R^2=0.9822$  (1)

250 Where *IP* is inflation pressure

251 *VL* is vertical load

252 *WS* is wheel speed

253 *MR* is motion resistance

254 **Validation of model**

255  $MR = +22.51389 - 0.086379IP - 0.023379VL + 5.44293WS$   $R^2=0.97274$  (2)

256 Where *IP* is inflation pressure

257 *VL* is vertical load

258 *WS* is wheel speed

259 *MR* is motion resistance

260 **4. Discussion**

Comment [FS21]: I think it will be better for the readers to divide this section to sub-sections

261 Table 1-4 contain the actual velocity of the carriage, theoretical velocity, wheel radius,  
262 load (weight), torque, drawbar wheel slip motion resistance, contact area and motion resistance  
263 ratio (8% and 10%) and inflation pressure of 274 kPa and 380 kPa respectively. Figure 5 and  
264 Figure 6 showed the relation of tire contact area pressure with vertical load and tire inflation

265 pressure. The tire contact pressure has a direct relation with vertical load and inflation pressure  
266 of the wheels. The contact area for all tests was in the range of 309-330 cm<sup>2</sup> as shown in Figure 3  
267 - Figure 4. Average contact pressure increased nearly linearly with increase in vertical load and  
268 increase in inflation pressure. Comparing the results of contact area of tire-land with the results  
269 of Cesbron *et al.* (2008) whose research about tire contact area showed that there is not much  
270 different between tire contact areas in static and dynamic conditions (about 20%). Table 5 shows  
271 the analysis of variance (ANOVA), for the effect of tire inflation pressure (P) and vertical load  
272 (W) and the interaction of them on wheel Motion Resistance (MR). This table shows that both of  
273 these two parameters have significant effect on MR changes. More ever the interaction of  
274 independent variables (P, W) on dependent variable (MR) was significant with the probability  
275 rate of 95%. A typical plot of vertical load versus MR as shown in Figure 1- Figure 2. The R<sup>2</sup>  
276 value shows exponential fits that best describe the relationship between tire inflation pressure  
277 (P), vertical load (W) and the interaction of them on wheel Motion Resistance. Exponential  
278 regression were obtained for the two wheels to check for linearity at different moisture content,  
279 R<sup>2</sup> value for test wheel 1 with inflation pressure of 270 kPa at 8% moisture content was 0.9974  
280 while that of inflation pressure of 380 kPa at 10% moisture content was 0.9952; also for test  
281 wheel two (2) R<sup>2</sup> value was 0.9977 and 0.9914 at moisture content of 8% and 10% respectively,  
282 this shows for test wheel 1 with inflation pressure of 270 kPa at 8% moisture content showed  
283 more motion resistance compared to motion resistance of test wheel 1 at inflation pressure of 380  
284 kPa and 10% moisture content, while for test wheel 2 with inflation pressure of 270 kPa showed  
285 low motion resistance at 8% motion content. In general, at constant level of soil compaction, the  
286 MR was found to increase within the increase in vertical load, and in all inflation pressures, the  
287 effect of vertical load seems to be similar. Figure 6 showed the ~~comparism~~ comparison between  
288 Motion resistance (MR) for the two test wheel as the vertical load and inflation pressure  
289 increases. The increase in inflation pressure caused MR to decrease at some point, but this effect  
290 was not significant at low levels of vertical load. Kurjenluomar *et al.* (2009) reported “reduction  
291 of tire inflation pressure reduced MR and rut depth only on soft soil, when the soil strength was  
292 low, and in hard soil conditions the effect was opposite on MR” and this experiments were  
293 conducted in clay, the results conforms the result of their research, and shows that reduction in  
294 inflation pressure increases the MR of tire. Also Elwaleed *et al.* (2006) reported that reduction in  
295 tire inflation pressure by 171.8 kPa from the recommended value resulted in decrease of tire

Comment [FS22]: Why do you compare your study to this study? What do you mean by there is not much different

296 motion resistance ratio by 5.01%. However, further reduction by 380 kPa resulted in an increase  
 297 in tire motion resistance ratio by 9.96%, but their experiments were conducted on loosened soil  
 298 condition which was different from this test condition. The model established shows the  
 299 coefficient determination ( $R^2$ ) of 0.9822 and the validation shows  $R^2$  value of 0.9727

300 **Predictive models (exponential fit)**

301  $y = 5.3406e^{0.4858x}$   $R^2 = 0.9974$  Wheel 1, inflation pressure (274 kPa) (4.8)

302  $y = 4.9825e^{0.5152x}$   $R^2 = 0.9952$  Wheel 1, inflation pressure (380 kPa) (4.9)

303  $y = 5.4404e^{0.4721x}$   $R^2 = 0.9977$  Wheel 2, inflation pressure (274 kPa) (5.0)

304  $y = 6.7521e^{0.4261x}$   $R^2=0.9914$  Wheel 2, inflation pressure (380 kPa) (5.1)

305 **Other fits tested** :Linear fits ;  $R^2=0.9757$  , Logarithm fit;  $R^2=0.8792$  , Power fit;  $R^2=0.9761$

308

309 Plate 1. Test Rig facility

311 **5. Conclusion**

- 312 1. A single wheel test rig has been developed to study motion resistance of narrow wheels.
- 313 2. The effect of different inflation pressures and vertical loads on the motion resistance of
- 314 the narrow wheels have been investigated under different moisture content (8% and 10%)
- 315 3. Data to assist in the development of simple, low cost and easy to maintain agricultural
- 316 machines with narrow pneumatic wheel as traction members have been provided in terms of
- 317 motion resistance and motion resistance ratios.
- 318 4. The motion resistance ratio increases with increase in vertical load.

Comment [FS23]: I think this is not a conclusion

Comment [FS24]: You need to add more details, or delete this point
