1

EFFICACY OF DIFFERENT ORGANIC MANURES ON GROWTH AND YIELD PERFORMANCE OF ORGANICALLY GROWN TOMATO

ABSTRACT

The field experiment was conducted at the Horticultural farm of Sher-e-Bangla Agricultural University, Sher-e-Bangla Nagar, Dhaka -1207 during the period from October 2014 to March 2015 to find out the efficacy of different organic manures and different varieties on the growth, yield performance of organically grown tomato. The experiment comprised of two different factors: Factor A. four types of organic manure [M₀= Control (No organic manures application), M₁ = Cow dung (30 t.ha⁻¹), M₂ = Poultry manure (25 t.ha⁻¹) and M₃ = Vermicompost (20 t.ha⁻¹)] Factor B. three types of variety V₁ = BARI tomato 15, V₂ = BARI tomato 14 and V₃ = BARI tomato 2. The experiment was laid out in Randomized Complete Block Design (RCBD) with three replications. Encouraging responses were monitored in all respects. Among the treatment combination M₂V₁ (Poultry manure + BARI Tomato 15) showed the highest plant height, maximum number of flower cluster, number of flower per cluster, number of fruits per cluster and number of fruit per plant with improved fruit size. The maximum yield (86.25 t/ha) was recorded from the treatment combination of M₂V₁ (Poultry manure + BARI Tomato 15), while the treatment combination of M₀V₃ (Control treatment + BARI Tomato 2) gave the minimum yield (31.25 t/ha). Therefore, BARI Tomato 15 coupled with poultry manure can be the most suitable for enhanced yield and can be considered a noble practice in sustainable agriculture.

1. INTRODUCTION

16 17

18 Over the last two decades, organically grown vegetables have generated significant interest among 19 consumers and scientists due to healthier products and safer characteristics of human health. 20 Consumers demand for organic vegetables has also on the rise. Therefore, the sustainability of 21 vegetable production with a higher yield is the prime need to meet consumer demand. Furthermore, sustainable vegetable production has been often reported as an environmentally-friendly production 22 23 system able to produce food with minimal hazardous effect on ecosystems and the environment as 24 well as minimal use of off-farm resources [1]. However, the major drawback of organic vegetable 25 production is the lower yield compared to conventional agriculture [2, 3]. Therefore, farmers prefer to 26 use commercial synthetic chemical fertilizers for vegetable production. However, extensive use of inorganic fertilizer may lead to environmental pollution, including contamination of groundwater, and 27 28 soil acidification as well as increase de-nitrification resulting in higher emission of nitrous oxide (N₂O) to the atmosphere which is responsible for global warming. Therefore, there is a prime need to bring 29 30 the new management practice to increase nutrient availability, plant uptake, and assimilation, reduce 31 disease intensity in order to close the gap between organic and conventional yields [4, 5]. Application of organic manures can be an effective practice to produce tomato in a sustainable production 32 33 system. Organic manure is a source of food for the innumerable number of microorganisms and 34 creatures like earthworm who breaks down these to micronutrients, which are easily absorbed by the 35 plants. Organic manure plays a direct role in plant growth as a source of all necessary macro and micronutrients in available forms during mineralization, improving the physical and physiological 36 37 properties of soils. Organic manures such as cow dung, poultry manure, and vermicompost improve 38 the soil structure, aeration, slow release nutrient which supports root development leading to higher 39 growth and yield of tomato plants. The macronutrient calcium and micronutrients boron, manganese,

40 molybdenum and iron are important for tomato cultivation. Biologically active soils with adequate organic matter usually supply enough of these nutrients [6]. Tomato (Lycopersicon esculentum L.) is 41 42 one of the most popular and versatile vegetables in the world which is cultivated in almost all parts of 43 Bangladesh under both field and greenhouse conditions. Tomato fruits are eaten raw or cooked and 44 other dishes like as soups, juice, Jam, Jelly, ketchup, pickles, sauces, conserves, puree, paste, 45 powder, and other products. In terms of human health, tomato is a major component in the daily diet 46 and constitutes an important source of minerals, vitamins, and antioxidants, like lycopene. Lycopene 47 pigment is a vital anti-oxidant that helps to fight against cancerous cell formation as well as another 48 kind of health complications and diseases [7]. Nevertheless, it plays a vital role in providing a 49 substantial quantity of vitamin C and A in the human diet [8]. Increasing the production and improving 50 the keeping quality of tomato are of paramount importance, now-a-days, for meeting the internal demand of the consumers'. Hence efforts should be given to identifying varieties with high yield 51 52 potential in an organic production system influenced by the application of different organic manures. 53 Considering the above perspective, the present study was undertaken to identify the suitable tomato 54 variety and the efficacy of different organic manures which can promote growth, increase the yield of 55 tomato in a sustainable and environment-friendly way.

56 57

58 2. MATERIAL AND METHODS

59 60

2.1 Experimental Site

61 The experiment was conducted at the Horticultural farm of Sher-e-Bangla Agricultural University, 62 Dhaka, Bangladesh from October 2015 to February 2016. The location of the experimental site was 63 23º74'N latitude and 90º35'E longitude and at an elevation of 8.2 m from sea level. The climate of experimental site was under the subtropical climate, characterized by three distinct seasons, the 64 65 winter season from October to February and the pre-monsoon or hot season from March to April and 66 the monsoon period from May to October. The soil of the experimental area belongs to the Modhupur 67 Tract (AEZ No 28). It had shallow red brown terrace soil. The selected plot was medium high land and 68 the soil series was Tejgaon. The physicochemical properties of the soil in the experimental site are as 69 follows-

Textural class	Silty clay loam to clay loam
Bulk density (g cm ⁻³)	1.33
Particle density (g cm ⁻³)	<mark>2.61</mark>
Porosity (%)	<mark>46.9</mark>
pH	<mark>6.2</mark>
Organic carbon (%)	<mark>0.75</mark>
Organic matter (%)	<mark>1.12</mark>
Total N (%)	<mark>0.092</mark>
<mark>Available Ρ (μg/g)</mark>	<mark>18</mark>
Available K (meq/100g)	<mark>0.32</mark>

70

71 2.2 Planting Material

72 Three varieties of tomato were used in this experiment viz, $V_1 = BARI$ tomato 15, $V_2 = BARI$ tomato 14 73 and V_3 = BARI tomato 2.Tomato seeds were collected from Vegetable division, Horticulture Research 74

Centre (HRC), Bangladesh Agricultural Research Institute (BARI), Gazipur, Bangladesh.

75 2.3 Organic Materials

76 Four types of organic manure coded as M_0 = Control (No organic manure), M_1 = Cow dung (30 t.ha⁻¹),

Manure	<mark>N (%)</mark>	<mark>P (%)</mark>	<mark>K (%)</mark>
Cowdung (decomposed)	<mark>1.0±0.1</mark>	<mark>0.3±0.03</mark>	<mark>0.46±0.05</mark>
Poultry manure	<mark>1.25±0.13</mark>	<mark>0.70±0.07</mark>	<mark>0.95±0.10</mark>

M₂ = Poultry manure (25 t.ha⁻¹), M₃ = Vermicompost (20 t.ha⁻¹). Nutrient composition of different 77 78 organic manures applied in the experiment is as follows-

_	Vermicompos	<mark>it</mark>	 0.75±0.07	<mark>0.6±0.06</mark>	6 1.0±0.1	

80 **2.4 Experimental Design and Treatments**

The experiment was laid out in Randomized Complete Block Design with three replications. There were altogether 12 (4 x 3) treatment combination used in each block were as follows; M_0V_1 , M_1V_2 , M_2V_3 , M_0V_2 , M_1V_3 , M_3V_1 , M_0V_3 , M_2V_1 , M_3V_2 , M_1V_1 , M_2V_2 , M_3V_3 . The experimental plot was first divided into three blocks. Each block consisted of 12 plots. Thus, the total numbers of the plot were 36. Different combinations of treatments were assigned to each plot as per the design of the experiment. The size of a unit plot was 2.4 m ×2.4 m. A distance of 0.5 m between the plots and 1.0 m between the blocks was kept.

89 **2.5 Growth Condition of Tomato and application of Manures**

The experimental land area was prepared by several ploughing and cross ploughing with a power tiller followed by laddering to bring about a good tilth. The land was leveled, corners were shaped and the clods were broken into pieces. The weeds, crop residues, and stables were removed from the field. Total organic manures were applied according to their treatment and finally leveled. Thirty daysold healthy seedlings were transplanted at the spacing of 60 cm × 40 cm in the experimental plots. Thus the 24 plants were accommodated in each unit plot.

96 **2.6 Data Collection and Analysis**

97 Five plants were randomly selected from each unit plot for the collection of data. The plants in the 98 outer rows and the extreme end of the middle rows were excluded from the random selection to avoid 99 the border effect. The height of the plants was measured from the ground level to the tip of the 100 highest leaves. The data obtained for different parameters were statistically analyzed to find out the 101 significant difference of variety and different manure application on yield and yield contributing 102 characters of tomato. The mean values of all the characters were calculated and the analysis of 103 variance was performed by the 'F' (variance ratio) test. The significance of the difference among the 104 treatment combinations means was estimated by the Duncan's Multiple Range Test (DMRT) at 5% 105 level of probability.

106

107 3. RESULTS AND DISCUSSION

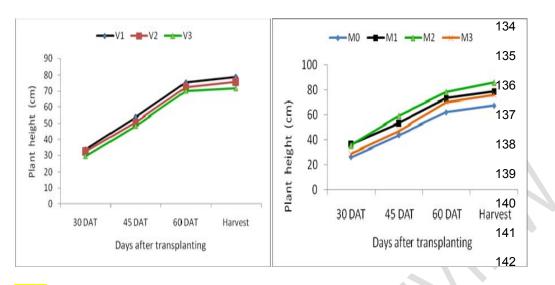

108

109 3.1 Plant height (cm)

110 Application of organic manures exhibited a significant influence on the height of tomato plants at 30, 111 45, and 60 days after transplanting (DAT) and at final harvest (Figure 1). At 30 DAT, the tallest plant 112 (35.68 cm) was found in the application of poultry manure (M₂) and the shortest plant (26.33 cm) was recorded from the control treatment (M₀). At 45 DAT, the plant height (59.32 cm) was recorded from 113 114 M₂, while the lowest (43.88 cm) was recorded from M₀. At 60 DAT, the longest plant (77.35 cm) was 115 recorded from M₂ and the shortest plant (62.08 cm) was recorded from M₀. At final harvest, plant 116 height ranged from 67.44cm to 83.90 cm. The highest plant (83.90cm) was recorded from M₂, while 117 the lowest (67.44 cm) was recorded from M₀. Poultry manure is rich in its nitrogen and nutrient 118 content. This favorable condition creates better nutrient absorption and favors for vegetative growth. 119 Consequently, longest plant was found by application of poultry manure. This is an agreement with 120 the findings of [6].

121

122 Different varieties showed significant influence on plant height of tomato plants at different DAT and 123 final harvest (Figure 1). At 30 DAT, the tallest plant (33.71 cm) was found from V₁ (BARI Tomato 15) 124 and the shortest plant (29.53 cm) was found from variety V_3 (BARI Tomato 2). At 45 DAT, the highest 125 plant height (53.77 cm) was recorded from V₁, while the lowest (48.48 cm) was recorded from V₃. The 126 plant height ranged from 70.31 cm to 75.33 cm at 60 DAT. The longest plant (75.33 cm) was recorded 127 from V_1 and the shortest plant (70.31 cm) was recorded from V_3 . At the final harvest, the highest plant (78.12 cm) was recorded from V₁, while the lowest (71.88 cm) was recorded from V₃. Organic matter 128 129 improves soil structure, increases the water holding capacity and promotes biological transformations 130 such as N-mineralization and enhances crop growth and development [9]. The results of this study 131 are also in agreement with the findings of [10, 11]. 132

The variation was found due to the combined effect of organic manure and variety on plant height at 146 147 different days after transplanting (Table 1). The maximum plant height (48.80cm) was recorded from 148 the treatment combination of M_2V_1 , while the treatment combination of M_0V_3 gave the minimum plant 149 height (16.66 cm) at 30 DAT. At 45 DAT significant differences in terms of plant height was observed 150 among the treatment combinations. However, the largest plant height (75.08 cm) was recorded from 151 the treatment combination of M₂V₁ whereas the minimum (36.20 cm) was recorded from treatment 152 combination of M_0V_3 . At 60 DAT, the tallest plant (90.61 cm) was recorded from the treatment 153 combination of M_2V_1 , while the minimum plant height (51.22 cm) was recorded from treatment 154 combination of M_0V_3 . At harvest, the maximum plant height (97.80 cm) was obtained from the 155 treatment combination M_2V_1 whereas the minimum (58.90 cm) was found from the treatment 156 combination of M₀V₃.

159 In a column, means followed by same letter (s) do not differ significantly at 5% level of probability, M_0 160 = Control, M_1 = Cowdung (30 t.ha⁻¹), M_2 = Poultry manure (25 t.ha⁻¹) and M_3 = Vermicompost (20 t.ha⁻¹), V1 = BARI tomato 15, V_2 = BARI tomato 14 and V_3 = BARI tomato 2

162

163 3.2 Number of flower clusters per plant164

Application of organic manures exhibited a significant influence on the number of flower cluster per tomato plant (Table 2). The maximum number of flower clusters per plant (9.74) was recorded from M_2 (Poultry manure), which was statistically identical (8.89) to M_1 while the minimum (8.27) was obtained from M_0 (Control treatment).

A significant variation was recorded due to the combined effect of different varieties on a number of flower clusters per plant under the present investigation (Table 2). The maximum number of flower cluster per plant (10.61) was recorded from V₁ (BARI Tomato 15) and the minimum number of flower cluster per plant (7.49) was obtained from V₃.

173

The variation was found due to the combined effect of organic manure and varieties for a number of flower cluster per plant (Table 3). The maximum number of flower cluster per plant (11.64) was recorded from the treatment combination of M_2V_1 (Poultry manure + BARI Tomato 15) which was statistically identical to M_2V_2 (11.37) (Poultry manure + BARI Tomato 14), while the treatment combination of M_0V_3 (Control + BARI Tomato 2) gave the minimum (6.34) number of flower clusters per plant. This study is almost similar to the findings of [**12**].

180 181

181 3.3 Number of flowers per cluster182

The number of flowers per cluster varied significantly due to the application of organic manures under
 the present study (Table 2). The maximum number of flowers per cluster (9.24) was recorded from M₂
 (Poultry manure), while the minimum (8.41) was obtained from control (M₀). These findings are similar
 to the findings [9, 11].

187 Different varieties showed a significant variation in the number of flowers per cluster under the present 188 trial (Table 2). The maximum number of flowers per cluster (10.52) was recorded from V₁ (BARI 189 Tomato 15) which was statistically similar to V₂ (BARI Tomato 14) and the minimum number of 190 flowers per cluster (7.07) was found from V₃ (BARI Tomato 2).

191

199

The variation was also found due to the combined effect of organic manures and varieties on a number of flowers per cluster per tomato plant (Table 3). The maximum number of flower per cluster (11.43) was recorded from treatment combination of M_2V_1 (Poultry manure + BARI Tomato 15), while the treatment combination of M_0V_3 (Control + BARI Tomato 2) gave the minimum number of flowers per cluster (5.58).

198 3.4 Number of flowers per plant

Number of flowers per plant varied significantly due to the application of different organic manures (Table 2). The maximum number of flowers per plant (58.25) was recorded from M_2 (Poultry manure), while the minimum (36.11) was obtained from control treatment (M_0).

Different varieties showed a significant variation in a number of flowers per plant under the present investigation (Table 2). The maximum number of flower per plant (48.05) was recorded from V₁ (BARI Tomato 15) and the minimum number of flowers per plant (44.47) was found from V₃ (BARI Tomato 2). Application of manure facilitates a slow release of nutrients and facilitates better nutrient uptake and assimilation during reproductive growth which might be the reason for the higher number of flowers per plant of tomato [11].

209

The variation was found due to the combined effect of organic manures and varieties on a number of flowers per plant (Table 3). The maximum number of flowers per plant (91.16) was recorded from the treatment combination of M_2V_1 (Poultry manure + BARI Tomato 15), while the treatment combination of M_0V_3 (Control +BARI Tomato 2) performed the minimum number of flowers per plant (26.40).

216 3.5 Number of fruits per plant

218 Number of fruits per plant differed significantly by application of different organic manures under the 219 present investigation (Table2). The maximum (42.07) number of fruits per plant was recorded from M₂ 220 (Poultry manure), while the minimum (26.83) was recorded from M₀ (Control treatment). It was 221 revealed that the number of fruits per plant increased in poultry manure. This might be caused that 222 Poultry manure content high amount of nitrogen and nitrogen enhance photosynthesis, cell division, 223 and cell enlargement. A similar trend of the results was found by [13] who reported that application of 224 manure improves microbial population and facilitates better nutrient uptake and increased the number 225 of fruits per plant. 226

227 Different varieties showed a significant variation in a number of fruits per plant under the present trial 228 (Table 2). The maximum (36.65) number of fruit per plant was recorded from V₁ (BARI Tomato 15) 229 and the minimum (31.63) number of fruits per plant was observed in V₃ (BARI Tomato 2). The reports 230 also supported by the results of [**5**, **9**, **11**].

Significant differences on a number of fruits per plant were recorded due to the combined effect of organic manures and varieties (Table 3). The maximum (55.91) number of fruit per plant was recorded from treatment combination of M_2V_1 (Poultry manure + BARI Tomato 15), while the treatment combination M_0V_3 (Control +BARI Tomato 2) gave the minimum (15.70) number of fruits per plant.

251 3.6 Length of individual fruit (cm)

252

Length of individual fruit varied significantly for different organic manures (Table 4). The maximum length of individual fruit (7.97 cm) was recorded from M_2 (Poultry manure), while the minimum (6.29 cm) was recorded from M_0 (Control) which was statistically identical (7.71 cm) to M_3 (Vermicompost). Similar types of results can be found by [**14**, **15**].

258 Different varieties showed a significant variation in the length of individual fruit under the present 259 investigation (Table 4). The maximum (7.66 cm) length of individual fruit was recorded from V₁ (BARI 260 Tomato 15) and the minimum (6.66 cm) length of individual fruit was obtained from V₃ (BARI Tomato 261 2).

The variation was found due to the combined effect of organic manures and varieties for the length of individual fruit under the present trial (Table 5). The maximum (10.94 cm) length of individual fruit was recorded from treatment combination of M_2V_1 (Poultry manure + BARI tomato 15), while the treatment combination of M_0V_3 (Control treatment + BARI Tomato 2) performed the minimum (4.08 cm) length of individual fruit.

3.7 Diameter of individual fruit (cm)

267 268 269

Diameter of individual fruit significantly influences by different organic manures (Table 4). The maximum (10.43 cm) diameter of individual fruit was recorded from M_2 (Poultry manure), which was statistically identical with M_3 (9.44 cm) and M_1 (10.35), while the minimum (8.84 cm) was recorded from M_0 (Control treatment). This trend is similar to [**16**, **17**].

274

275 Different varieties showed a significant variation on the diameter of individual fruit under the present 276 investigation (Table 4). The maximum (10.18cm) diameter of individual fruit was recorded from V₁ 277 (BARI Tomato 15) and the minimum (9.18cm) diameter of individual fruit was obtained from V₃ (BARI 278 Tomato 2).

279

The combined effect of organic manure and varieties varied significantly on the diameter of individual fruit (Table 5). The maximum (13.31 cm) diameter of individual fruit was recorded from treatment combination of M_2V_1 (Poultry manure + BARI Tomato 15), while the treatment combination of M_0V_3 (Control treatment + BARI Tomato 2) gave the minimum (6.60 cm) diameter of individual fruit. Our findings are in agreement with the findings of [**18**].

286 3.8 Weight of individual fruit (g)

287

288 Weight of individual fruit varied significantly due to the application of different organic manures (Table 289 4). The maximum (123.33 g) weight of individual fruit was recorded from M_2 (Poultry manure), while 290 the minimum (91.69g) was recorded from M_0 (Control treatment). 291

A significant variation found different varieties on the weight of individual fruit under the present trial (Table 4). The maximum (134.58 g) weight of individual fruit was recorded from V₁ (BARI Tomato 15) and the minimum (99.18 g) weight of individual fruit was recorded from V₃ (BARI Tomato 2).

The variation was found due to combined effect of organic manures and varieties on weight of individual fruit (Table 5) The maximum (176.66 g) weight of individual fruit was recorded from treatment combination of M_2V_1 (Poultry manure + BARI Tomato 15), while the treatment combination 299 of M_0V_3 (Control treatment + BARI Tomato 2) performed the minimum (73.41 g) weight of individual 300 fruit. Application of manure supplies slow release of nutrients and increase the accumulation of 301 carbohydrates, which might be the reason for higher individual fruit weight. This was supported by 302 [19, 20, 21]. 303

304

3.9 Yield (kg plant⁻¹) 305

306 Yield per plant varied significantly due to the application of different organic manures (Table 4). The 307 maximum (2.06 kg.plant⁻¹) yield was recorded from M_2 (Poultry manure), while the minimum (0.99 308 kg.plant⁻¹) was found from M_0 (Control treatment). Poultry manure is rich in its nitrogen and nutrient 309 content. These favorable conditions create better nutrient absorption and favor the growth and 310 development of the root system which in true reflects better vegetative growth, photosynthetic activity. 311 Consequently a higher total yield would be obtained by poultry manure. The results also agreed to the 312 findings of [22]. 313

314 Different varieties showed a significant variation on yield per plant under the present investigation 315 (Table 4). The maximum (1.75 kg.plant¹) yield was recorded from V₁ (BARI Tomato 15) and the 316 minimum (1.37 kg.plant⁻¹) yield was obtained from V₃ (BARI Tomato2). A similar trend of results was 317 found by [23]. 318

319 The variation was found due to the interaction effect of organic manures and varieties for yield per 320 plant (Table 5). The maximum (2.07 kg.plant¹) yield was recorded from treatment combination of 321 M_2V_1 (Poultry manure + BARI Tomato 15), while the treatment combination M_0V_3 (Control treatment + 322 BARI Tomato 2) gave the minimum yield (0.75 kg.plant⁻¹). Application of organic manure supply plant 323 nutrients, including micronutrients, improve soil physical properties like structure, water holding 324 capacity, increase the availability of nutrients and favors the beneficial microorganisms which 325 positively increase the yield and guality of tomato [24,25].

343

344

345 4. CONCLUSION 346

347 In this study, organic manures played a significant role in enhanced growth and yield performance of tomato in a sustainable production system. BARI Tomato 15 coupled with poultry manure enhanced 348 349 vegetative and reproductive growth with a higher yield of tomato by the slow and steady release of 350 nutrients to the plants compared to other treatments. Thus the application of BARI Tomato 15 coupled 351 with poultry manure can reduce the cultivation cost of tomato while minimizing pollution by excessive 352 use synthetic fertilizers and could be considered as a good production strategy for obtaining high 353 yields with lower impact on the environment.
