SOURCES OF INFORMATION & THEIR EXTENT OF UTILIZATION BY ACTORS IN AKIS FOR BETEL VINE GROWERS IN NADIA DISTRICT OF WEST BENGAL

3 **Abstract:**

4 Studying Agriculture Knowledge Information System (AKIS) in terms of generation, 5 dissemination, transformation, utilization, storage and retrieval of knowledge and information 6 is needed for agriculture development. A study was conducted in Nadia district of West 7 Bengal and Betel vine growers, Extensionist, Researchers were considered as respondents. 8 Cultivation of betel vine is one of the most important horticultural crops at it is gradually 9 increasing its popularity in the Nadia district as cash crop. It is observed that in- adequate information regarding Betel vine production in the sampled areas, almost cent percent 10 11 growers were using their own traditional planting materials since long and growing their 12 crops with their indigenous knowledge, skill and their past experiences. They have little 13 awareness regarding the improved method of cultivation. The study further indicated that the 14 respondents were receiving better information and technical knowhow about betel vine 15 cultivation from Opinion leader, participating in training programmes, discussing with 16 Extension personnels, input dealers, neighbours and different NGOs and to some extent from 17 electronic media. The respondents treated relatives, neighbours and co-operatives as better 18 credible sources followed by demonstration, campaign, Argil. University expert, Krishi-mela, Leaflet and Input dealers and electronic media to some extent. Establishment of research 19 20 station, transfer knowledge information system and marketing system might be useful for 21 realising better return on betel vine cultivation and young farmers are quite enthusiastic to 22 cultivate the betel vine and promotion of this crop should be continued in the other parts of 23 the district for gainful employment through need based and location specific technology 24 support system.

Keywords: (AKIS) Agricultural Knowledge Information System, Researcher,
 Extensionists, Technology development and transfer, Integration, diffusion and utilization of
 Information.

28

29 Introduction:

The present age has been rightly called as an information age. Information has become the most important element for progress in society. According to Kemp "information has been described as the fifth need of man ranking after air, water, food and shelter". Providing information on farming practice, market information helps farmer make correct 34 decision. Constraints existing in interface between generation, transfer and use of farm 35 innovation should be removed through dual concept of synergy and Agricultural Knowledge 36 Information System (Saha, 2011). Effective technology development and transfer depends on 37 an interactive holistic system that is called the 'agricultural information system' which 38 includes: a research subsystem; a dissemination sub system; a user subsystem. An 39 agricultural knowledge information system is a system in which agricultural information is 40 generated, transformed, transferred, consolidated, received, utilized and feedback in such a 41 manner that these processes function synergically to underpin knowledge utilization by 42 agricultural producers (Roling, 1989). Agriculture Knowledge information System (AKIS) is 43 a system that links the rural peoples and institution to promote mutual learning and generate, 44 share and utilize agriculture related technologies, Knowledge and information, this system 45 integrates farmers, agriculture educators' research and extortionist to harness knowledge and 46 information from various sources for better farming and improved livelihood. An Agriculture 47 Knowledge information System (AKIS) is intended as a bridge for sharing ideas and 48 principles with various stakeholder.

AKIS is defined as "the set of organizations and /or persons, and the links and 49 interaction between them that are engaged in, or manage such processes as the anticipation, 50 51 generation, transformation, transmission, storage, retrieval, integration, diffusion, utilization 52 of agricultural knowledge and information, which potentially work synergistically to support 53 decision making, problem solving and innovation in agriculture on a domain thereof." 54 (Roling and Engel 1991). AKIS framework is useful in analysing how farmers are supported by institutions involved in the process of generating and diffusing new knowledge, i.e., 55 56 research, extension and education. The underlying feature of the AKIS in that farmers obtain 57 the knowledge and information from many sources and that new knowledge is generated not 58 only by research institutes, but also by many different actors, including farmers themselves 59 (Van Den Ban, 1996). The traditional role of the extension organization in less industrialized 60 countries is the transfer of technologies (TOT) developed at the research institutes of farmers. 61 A major role in industrialized countries has always been to learn from the experience of the 62 most successful farmers in order to teach other farmers how they can improve their farm 63 management. Quite often analysis of the AKIS shows that a role other than TOT is more 64 appropriate. This could involve providing farmers with a basket of opportunities and helping 65 them to choose the right one of their situation. Another role of the extension organization can 66 be:

67

•

- 68
- 69

to help farmers experiment with new technologies or with new farming system; to gain access to relevant information from a variety of information; •

- to evaluate and interpret this information for their own situation; and
- 70

to learn from their experiences. •

71 Betel vine or Pan (Piper betel L) belongs to the family Piperaceae and is a perennial 72 aromatic creeper grown for its leaves. India is the largest producer of betel leaves in the 73 world. It is an important commercial crop and is grown as a cash crop across the states of 74 Andhra Pradesh, Karnataka, Kerala, and Assam, Odisha, Uttar Pradesh and West Bengal. The 75 Indian betel leaves are in great demand in several countries and leaves worth about Rs. 30-40 76 million are exported to European countries (Guha, 2006). It is an opportunity for the Indian 77 betel vine growers as well as seller to earn more profit not only within the country but also by 78 exporting .About 20 million people derives their livelihoods directly or indirectly from 79 production, processing, handling, transportation and marketing of betel leaves in India (Guha, 2006). On an average about 66% of such production is contributed by the state of West 80 81 Bengal where it is cultivated on about 20,000 ha encompassing about 4-5 lakh employing about the same number (4-5 lakh) of agricultural families (Guha, 2006). 82 Betel vine 83 cultivation has brought a paradigm shift in the farm economy in West Bengal and offers perennial employment and income to small and marginal farming community because of its 84 capital and labour intensive characteristic (Chandra& Sagar, 2004). It is the most important 85 cash crop and its cultivation has already brought a perceptible and conspicuous change in the 86 livelihood security of farmers in Nadia district. However, the betel vine is susceptible to 87 88 damage caused by insects, rain and wind. Shortage of irrigation can also cause hindrance for 89 the growth of betel vine. High cost of fertilizer and pesticide, fluctuating price, many 90 intermediaries, inadequacy of finance, transport, absence of grading, lack of storage facility 91 also cause of great loss to farmers. In view of the above problems in betel vine cultivation the 92 current study was undertaken with an objective to identify the sources of technological information & their extent of utilization by actors in agriculture knowledge information 93 94 system for betel vine growers in Nadia district of West Bengal.

95 Material and methods:

96 The study has been oriented towards the system approach for analyzing the 97 Agriculture Knowledge Information System of betel vine growers in Nadia district. The present study was undertaken in Nadia district of west Bengal to identify the sources of 98 99 information & their extent of utilization by actors in agriculture knowledge information

system for betel vine growers. Multi-stage stratified sampling procedure was employed for 100 101 selection of blocks, villages and betel vine growers. Four blocks namely Karimpur 1, 102 *Karimpur 2, Krishnaganj* and *Chakdah* were purposively selected from Nadia district as betel 103 vine is a major cash crop in this area. Eight villages predominated by betel vine growers 104 namely Arabpur, Kechuadanga, Rajapur, Hogolberia, Taldah, Adityapur, Simurali and 105 Anyetpur were selected purposively from above four mentioned blocks. Two hundred betel 106 vine growers from the selected villages were selected randomly by selecting 25 farmers from 107 each village. All the extensionists working in the field of betel vine cultivation in the study 108 area and all the extensionists (25) were selected for the purpose of study. All the researchers 109 (10) related with betel vine cultivation in the study area were also interviewed. The primary 110 data were collected from the sample respondents by semi-structured schedules, pre -tested 111 earlier through personal interview method in the year 2015-16 and analysed to reveal the 112 results. In order to measure extent of use of sources of information, measurement of 113 frequency use of sources and channels was followed. The data on source of information were collected on scale point of Most often, Often, Some times and Never with assigned score 114 115 were 4,3,2,1 respectively and information on credibility of sources were collected on scale 116 point, Most reliable, Somewhat reliable, Unreliable with assigned score were 3, 2, 1 117 respectively. The total preference score for each content was calculated and mean score for 118 particular source of information was worked out, and then ranking was done on the basis of 119 CV percentage. The data were compiled, tabulated and analysed by using the statistical tools such as mean, standard error and CV (%). 120

121 **RESULT AND DISCUSSION**

The findings of the present study as well as relevant discussions have been 122 summarised under the following heads. Access to information is very essential to increase 123 124 agricultural productivity and considering the changing nature of agriculture and the evolving challenges, farmers currently needs a wider range of support including organizational, 125 126 marketing, technological, financial, and entrepreneurial support service. Farmers require 127 location specific information system for agriculture development to meet different challenges 128 in their production context. The farmers depend on extension personal to get the proper 129 advice to accelerate the crop production. The information needed are related to different schemes, crops, technologies needs, fertilizers, pesticides ,availability of fertilizers, bio -130 131 pesticides, soil fertility, pest and disease diagnosis and many more. The agricultural 132 marketing information is essential for farmers to increase their profit. Information such as price details of seeds, fertilizers and availability of these products market enable the farmer to 133

make decision in choosing right items for better farming. Sources of information are an important consideration which determines the level of education, exposure and cosmopolitness. Mean score of each sources of information and its extent of use by the respondents were calculated and on that basis the different sources of information were ranked and presented in the Table 1.

Sources/Channel	Frequency contact				Credibility of Sources/ Channel			
	Mean	Std Error	CV %	Rank	Mean	Std Error	CV %	Rank

139 Table 1: Sources of information , extent of use and its credibility

(<u>n</u>=200)

141 From the above table it has been found that village teacher (12.006), training camp 142 (12.006) have been assigned by the respondents, as the first rank followed by betel leaf 143 vender (13.760), youth club (17.8010), KPS (18.890), Extension personnel (19.246), 144 ADA/HDO (22.080), Input dealers (24.132), Agril. University expert (25.915), 145 Demonstrations (25.915), Krishi-mela (27.207), KVK (27.207). This indicated that farmers 146 had good contact, good rapport and depending more on the above mentioned sources of 147 information. The respondents had expressed that they have moderate contact with 148 Panchayat personnel (27.800), Research station/ Adaptive farm, Bank personnel (28.243), 149 Village leader (30.277) Folder/Leaflet (31.179), Radio programme (31.286), Field day, 150 Village level workshop (31.330) and least contact with SHG (32.112), friends (32.361), 151 Leaflet (33.028), TV programme (33.817), Cooperatives(36.814),) News paper (36.959), 152 NGO (37.916), Neighbour (39.298), Opinion leader (41.69) Relatives (41.399).

Very limited exposures were observed on receiving information from various sources by the respondents. The respondents were receiving information through Opinion leader, training programmes, Extension personnel, input dealer, neighbour and different NGO and to some extent electronic media. It can be apprehended that the respondents were receiving information mainly through individual contact. Similar results were observed by (*Engel 1997*), *Pandey* (*1998*) and (*Silerova and Lang 2006*) with respect to AKIS.

159 Credibility of sources:

It was revealed from the above table that the respondents treated Betel leaf vender 160 161 (7.036), Training camp (7.036) and Krishi Vigyan Kendra (7.036) as most credible source of information and ranked first among all sources/channels, followed by Demonstration 162 163 (9.8720), and Campaign (9.876) Argil. university expert (15.546), Krishi-mela (15.546), KPS, Leaflet (16.603), Panchayat personnel(18.134), Radio programmes (18.890), 164 ADA/HDO (20.266), Input dealers (20.759), Folder, leaflet (22.461), SGH (22.895), 165 166 Progressive farmer (25.059), Village leader (26.321), Friends (29.124), Opinion leader 167 (32.666), TV programmed (32.682), News paper (34.311), NGO (36.247), Cooperatives 168 (36.886), Neighbour (37.869), Relatives (40.899).

169 The respondents were gaining better credibility of sources from relatives, neighbour 170 and co-operatives. It can be also concluded that respondents were receiving of credibility of 171 sources from print and electronic media to some extent.

172 CONCLUSION

140

173 The study revealed that Agricultural Knowledge Information System (AKIS) for the 174 past few decades has made an impressive linking in the minds and thoughts of policy makers, 175 development planners, extension as well as researchers as a mechanism to build linkage 176 between farmers, extension workers and researchers. AKIS in betel vine cultivation has 177 gained momentum after establishment of Horticulture Department and KVK in West Bengal 178 at various district head quarters. Physical, social and cultural environments, land availability 179 and needed inputs, the sustainability of utilities and communication network are the 180 important factor that affects the success of the AKIS in betel vine cultivation. The key 181 findings of the study can also provide significant benefits not only for the betel vine growers 182 but also to the Extension workers, Researcher, related developmental departments and district 183 administration for effective implementation of the agriculture knowledge information system 184 (AKIS). A number of practical implementations such as policy considerations, linkages with 185 stakeholders and marketing could be helpful for the betel vine growers of Nadia district for 186 better livelihood. It is concluded that information delivery system should be strengthened to 187 increase the effectiveness of existing agricultural research extension and farmer's linkage and 188 more priorities should be given on advocacy, capacity development and integration of 189 information resources. 190 **Reference:** Chandra, G. and Sagar, R.
