

**Editor's Comment:**

I consider that the author should speak out on this new observation.

After analyzing the conclusion, I verified that the association by the author in the last paragraph continues with a confounding factor since in table 1 everything became clear and in this case it becomes repetitive and perhaps unnecessary.

I believe that in the CONCLUSION ... only the first paragraph added "Factors which can affect Alpha to Beta myosin heavy chain ratio will produce changes in the velocity of contraction, and consequently the rate of ATP consumption." ..... .. would be clear, sufficient and concordant with the article keeping the paragraph descriptive of the activities of the proteins in the body of the text.
