

**Editor's Comment:**

I am sending you my comments to manuscript 2019/SAJP/46887 "AGE AND SEX RELATED PREVALENCE AND DISTRIBUTION OF HOOKWORM INFECTION AMONG PUPILS OF UNIVERSITY OF CALABAR STAFF SCHOOL, CALABAR, NIGERIA".

I agree with the colleagues that there are minimal errors in the work presented by the proponent. It could be improved in terms of its structure. However, its importance lies in the assessment of parasitosis to known a mayor of public health problem. Hookworm infections have decreased in recent years due to the increasing development of the country and other personnel hygiene observed that, continuous deworming program should be conducted in primary schools to lower the rate of infection.
