

Editor's Comment:

After considering this manuscript, I would recommend to 'reject'.

This decision was based on

1. The ambiguous in the study design of this study. I felt this study was very close to case-control study, however, this manuscript only state epidemiology or retrospective study which are very broad terms.
2. The analysis using OR was acceptable but not consistency. For example, table 2 needs OR analysis.
3. The statistical analysis method for sample normality was omitted. Additional univariate and multivariate logistic regression analysis would greatly improve the manuscript.
4. It is mandatory for this manuscript to get the service from a professional English language editor.
