SDI EDITORIAL COMMENTS FORM

EDITORIAL COMMENT'S on revised paper (if any)	Authors' response to editor's comments
The title should specify the location of the study as "***Antibiotic* sensitivity profiles of *Salmonella typhimurium* and *E. coli O157: H7* isolates from ready to eat chicken meat in Ibadan-Nigeria**".	**Title modified with inclusion of Ibadan, Nigeria**
Summary: specify the country. What is Ibadan? If it's a city, please quote the country. Among the keywords you can add Ibadan.	**Ibadan was included in the summary and keywords**
Introduction: The authors should provide us with information on the nutritional value of chicken meat before addressing the safety aspect.	**Nutritional value of chicken meat was included**
Methods: the method is well developed but does not have many references. Results: alternate tables with figures. There is too much table and no figure. **Discussion**: the discussion is focused around antimicrobial resistance. Authors should talk a little about the identification of germs sought. Is *E. coli* and *Salmonella typhimurium* were isolated from chicken meat in other studies? What was the prevalence compared to this study? Finally, the authors should consider the comments of the evaluators. Names (species and genera) are always italicized. But this was not respected especially in the list of references. **References**: There are many studies on antimicrobial resistance. Authors should add recent and new references 2015, 2017, 2017 .... For a good visibility, it is necessary to respect the instruction to the authors.	**Method section was referenced appropriately.** **In the results, only 2 tables on antimicrobial resistance patterns could be fairly represented with figures but this could not be done because of identification of each sector of the pie chart and loss of precision due to approximation of values. Table is the most preferred presentation of these results.**
The manuscript can be accepted after revision. Then you need also reassurance about the ethical aspects.	**Authors took all comments very important and scientifically approached each comment.** **References have been modified.** **Ethical Committee approved the study before its commencement**
