

SDI FINAL EVALUATION FORM 1.1

PART 1:

Journal Name:	Asian Journal of Pediatric Research
Manuscript Number:	Ms_AJPR_46024
Title of the Manuscript:	Acute osteomyelitis of the posterior column of the acetabulum: About a case
Type of Article:	Case report

PART 2:

FINAL EVALUATOR'S comments on revised paper (if any)	Authors' response to final evaluator's comments
<p>The discussion is much better now. I still do not think this is the only interpretation for the case, but is one of the possibilities. When talking about the diagnosis itself, the author could use words like "probably" or "possible".</p> <p>The Conclusion presented by the author cannot be made by this work. Those are correct assertions, but this Case Report does not lead to them.</p> <p>The Conclusion must answer the question implied in the objectives of the work. In this case: "We present the case of an 11 - year - old boy who had acute osteomyelitis of the posterior acetabulum, in order to present the diagnostic and radiological difficulties as well as the prognosis of acute haematogenous osteomyelitis of the acetabulum".</p> <p>The author did describe this case (...), which points to the difficulty in diagnosis (...). That is the conclusion. (In a Case Report, the Conclusion is something like an abstract).</p>	<p>Our observation concerns a rare localization of pelvic osteomyelitis. Diagnostic discrepancies, especially with Ewing's sarcoma, underline the interest of early MRI. The prognosis is favorable but decreases with a delay in antibiotic administration.</p>
