

Editor's Comments:

1) There are several mistakes along the text:

For instance:

page three: Biomass can mainly be supplied through three different sources (???? blank space)

(1) Agriculture; (2) forestry; and (3) waste materials. Most of the countries utilise resources from these sources to develop a sector for modern bio-energy producing plants.

page five: "cellulose Even though the process in a landfill is slowed, it promote methane gas production as the waste productwhich is"

2) The introduction is poor and without references. Why?

3) As a review, unless this seems a review, the references given are not enough.

4) Check the style of the article, for instance, it is appropriate to present a table in part 6 with a out indicating that it is a table, or is it text?

5) References style should be check according with journal style.
