

**Editor's comments:**

The manuscript is informative and presents an interesting data. However, some changes mostly linguistic ones are recommended. Most pronouns (i.e., we, our) should be replaced by the passive voice. The list of references should be rechecked (see journal acronyms). Moreover, limitations and clinical implications of the obtained data should be added.

**Author's feedback:**

Some of the recommendations described above were accepted. Regarding the clinical implications of the patients, we did not have access to the patients' charts, so we do not have this information.
