

Editorial Comment:

In first line of results and discussion, i see the statement "There was a significant difference between the levels of salinity for fresh fruit weight of acid lime 'Tahiti' with increasing loss of fresh weight over time of storage" if the authors have done analysis of variance, it should be show into the text by tables and also for Tukey test, it is important to make facility for readers. MINOR REVISION NEEDED.

Author Feedback:

The data were submitted to analysis of variance when detected significant effect for the test F applied the Tukey test at the level of 5% probability. The results were analyzed using the statistical package AgroEstat®, which can be visualized with the equation of polynomial regression represented in all the graphs. I do not find it interesting to show tables of analysis of variance in the text, I try in view that are several tables that would probably leave the text tiring and confusing, since the results that are interesting the research is already available in graphics.
