

1 **AGED AWARENESS AND PERCEPTION OF CLIMATE VARIABILITY**  
 2 **IN KANKE AND RIYOM LOCAL GOVERNMENT AREAS OF PLATEAU**  
 3 **STATE, NIGERIA.**

6 **ABSTRACT**

7 Plateau state is an area with contracting climate which results from the differential relief in the  
 8 environment. ~~The This study examined~~ aged's awareness and perception of climate variability in  
 9 Riyom and Kanke Local Government Areas (LGA)s of Plateau State was investigated in these  
 10 areas based on its relief. One local government were selected each from ~~There was random~~  
 11 selection of one local government area in the upper plateau (Kanke LGA) which lies in the upper  
 12 plateau and Riyom LGA which is in the another local government area in the lower plain of the  
 13 plateau. (Riyom LGA) because of the constrasting climate which is dominantly influenced by the  
 14 relief in the area. Quantitative ~~The research made use of quantitative data which~~ were obtained  
 15 through structured questionnaire administered to aged male, and aged female available in the  
 16 selected houses (the aged are people 60 years and over in age) in the selected rural communities  
 17 of Riyom and Kanke LGAs of Plateau State, Nigeria. Where there was no combination of the  
 18 two (aged men and aged women), either of the two was also sufficient. ~~The analysis was done~~  
 19 ~~using SPSS.~~ The study revealed there were more aged males than aged females;- 72.7% were in  
 20 the age range of 60-69; more than 80% were crop farmers and about 62.6% earned less than  
 21 N20,000 (56USD) per month. Also 86.3% have heard of climate change; 80.6% felt they understood  
 22 climate change; while 95% felt the climatic variability was increasingly changing. The study also  
 23 revealed that age and LGAs were major determinant of perception and awareness of climate  
 24 change. ~~It was This study therefore~~ concluded that in order to have an effective intervention for  
 25 climate change impact on the rural aged, their perception and response to climate change and  
 26 also peculiarities of the areas must be taken into consideration.

27  
 28 **Keywords: Climate variability, Climate change, Rural aged, Perception, Awareness**

30  
 31 **1.0 INTRODUCTION**

32 Climate change is the change in the state of the climate that can be identified by changes  
 33 in the mean and/or the variability of its properties and that persists for an extended period,  
 34 typically decades or longer (IPCC, 2007). Climate variability is defined as variations in the mean  
 35 state and other statistics of the climate on all temporal and spatial scales, beyond individual  
 36 weather events (World Metreological Organisation [WMO] 2017). Climate change and variability  
 37 constitute variability constitutes a major challenges in many rural communities in Africa because  
 38 of its low levels of awareness, human and financial resources and institutional and technological  
 39 capabilities (IPCC, 2001). This is the case in Nigeria, since a large share of the Nigerian  
 40 economy is dependent on climate-sensitive natural resources (IPCC, 2001). These challenges are  
 41 even more compounded in the country because of its low capacity to adapt to climate change due  
 42 to low levels of awareness, human and financial resources and institutional and technological  
 43 capabilities (IPCC, 2001).

Comment [S1]: Rephrase, suspected plagraism

Comment [S2]: Suspected plagraism in the  
 definations, rephrase

44 In Nigeria, women, children and the elderly are the most vulnerable to climate change  
 45 (DFID, 2009) with the elderly being the most vulnerable (Okoye, 2011). These elderly people  
 46 live mostly in rural areas of the country (Nigeria Bureau of Statistics, 2006). Rural communities  
 47 of Nigeria are increasingly populated with the very old who might be particularly susceptible to  
 48 the challenges of climate variability and change. **The aged are people 60 years and over in age.**  
 49 The aged are part of the disadvantaged populations in the rural areas and are very vulnerable to  
 50 many of the challenges due to their physical weakness, powerlessness and isolation which  
 51 continue to fortify poverty against them (Kolawole and Torimiro, 2006). In Nigeria, rural aged  
 52 may face higher levels of climate variability challenges than other rural populations and their  
 53 urban counterparts. This might be because of their level of awareness and perception of climate  
 54 variability and low social economic status. Therefore, their awareness and perception of this  
 55 variability is important.

56 Perception about climate change and variability is important in order to avoid  
 57 misconception of the situation which can be serious implications (Peters, 1997). It is important  
 58 to have a good knowledge and understanding of climate and also be able to respond  
 59 appropriately to it (Thomas *et al.*, 2007). The first prerequisite towards adaptation is a reasonable  
 60 perception of the problem (Falaki *et al.*, 2013, Gbetibouo, 2009). Falaki *et al.* (2013) opined that  
 61 one cannot adapt to climate change in an adequate way if the present and future climate change  
 62 is not perceived as a reality. Moniruzzaman (2013) also explained that by knowing the climate  
 63 literacy and wisdom of vulnerable community it is easier to take sustainable measures; policy  
 64 and action plan at national and international level.

65 Issues associated with climate change and variability has generated massive attention in  
 66 research. To exemplify, scholars have analyzed climate change in terms of its **Causes** (IPCC,  
 67 2007; Karl *et al.*, 2009; Odjugo, 2010; Bray, 2010); **Impact** (Deressa, 2007; Boko *et al.*, 2007;  
 68 Yesuf *et al.*, 2008; Deressa, Hassen, and Ringler, 2008; Muamba and Kraybill, 2010; Jianjun *et al.*,  
 69 2015); **Responses** (Deressa *et al.*, 2009; Smith and Olesen, 2010; Piya *et al.*, 2012; McNeely,  
 70 2012) and **Awareness and Perception** (Deressa *et al.*, 2009; Tologbonse *et al.*, 2010; Sofoluwe *et al.*,  
 71 2011; Mandleni and Anim, 2011; Iwuchukwu and Onyeme, 2012; Falaki, *et al.*, 2013; Amdu  
 72 *et al.*, 2013; Olajide O. Adeola, 2014; Abid *et al.*, 2015; Allahyari *et al.*, 2016). These studies on  
 73 climate change and variability did not address the issues in relation to the situation of the rural  
 74 aged. There are dearth in studies on awareness and perception of climate variability by the rural  
 75 aged population. Therefore this study raised a need for perception and awareness of climate  
 76 change to be considered in relation to the rural aged.

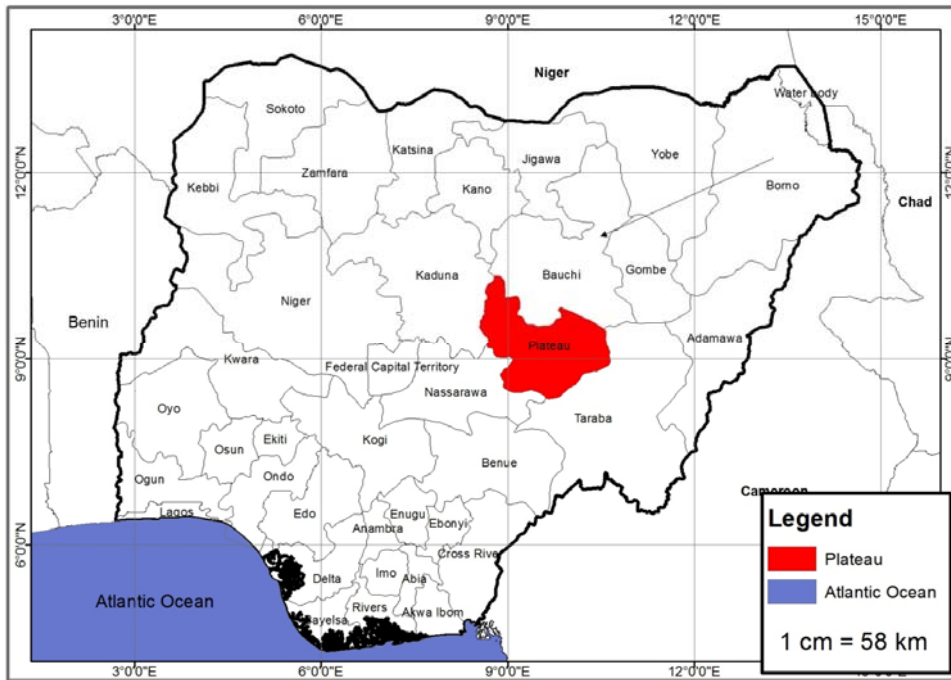

Comment [S3]: Any study on plateau?

## 77 2.0 MATERIALS AND METHOD

### 78 2.1 Study Area

79  
 80 Plateau State is situated in the central belt of Nigeria lying between latitude 8°30' and  
 81 10°30' North, longitude 7°30' and 8°37' East of the Equator. It is bordered by Bauchi to the  
 82 North-West and Kaduna to the North East, Nasarawa to the South-West and Taraba to the South-  
 83 East (Figure 1). The state has 17 Local Government Areas: Barikin Ladi, Bassa, Bokkos, Jos  
 84 East, Jos North, Jos South, Kanam, Kanke, Langtang North, Langtang South, Mangu, Mikang,  
 85 Pankshin, Qua'an Pan, Riyom, Shendam, Wase ([www.plateaustate.gov.org](http://www.plateaustate.gov.org)) out of which Kanke  
 86 and Riyom local government areas were selected for this study (Figure 2). **The random selection**  
 87 **of one local government area in the upper plateau (Kanke LGA) and one local government area**  
 88 **in the lower plain of the plateau (Riyom LGA) was done because the upland and lower areas of**

89 Plateau state has a contrasting climate which is dominantly influenced by its relief (Sanni,  
 90 2015). Plateau State has an almost temperate climate. It has a mean temperature that range  
 91 between 18°C and 22°C. The state has its warmest temperature in the dry season in the months  
 92 of March and April and its cold season between December and February. Also the highest  
 93 rainfall is recorded in the wet season in the months of July and August. The state average annual  
 94 rainfall varies from 131.75 cm (52 in) in the Southern part to 146 cm (57 in) on the Plateau.  
 95

119  
 120 **Fig.1. Map of Nigeria illustrating the Study Area**

121  
 122 According to the 2006 census, Plateau State had a population of 3,206,531 (1,598,998  
 123 males and 1,607,533 females). Riyom LGA of Plateau State had a population of 131,778 in 2006  
 124 (NPC, 2006) and in 2016, the projected population was 172,600. Also Kanke LGA population  
 125 was 124,268 in 2006 (NPC, 2006) and 2016 projected population was 162,800. Riyom local  
 126 government area has its headquarters in Riyom town while Kanke local government area has its  
 127 headquarters in Kwal town. There are several Districts & rural communities under Riyom and  
 128 Kanke local government area. The aged in the selected rural communities of the two LGAs  
 129 (Riyom and Kanke were few in number) especially in Kanke LGA where the numbers of the  
 130 aged were extremely very few in number. The selection of Riyom and Kanke local government  
 131 areas were random selection of one local government area in upper plateau (Kanke LGA) and  
 132 one local government area in the lower plain of Plateau State (Riyom LGA) because of the  
 133 contrasting climate.

Quantitative primary data was obtained through structured questionnaires and distributed to an aged male and aged female (60 years and above) available in the selected rural communities of the Kanke and Riyom local government areas of Plateau State, Nigeria. Where there was no combination of aged men and aged women, either of the two was seen as sufficient.

The initial stage involved the random selection of one local government area in the upper plateau (Kanke LGA) and one local government area in the lower plain of the plateau (Riyom LGA). This was done because the upland and lower areas of Plateau state has a contrasting climate because the state is dominantly influenced by its relief (Sanni, 2015). The second stage involved the selection of three rural settlements from each of the local government areas which was done by the simple random selection process. The fourth stage is the identification of the houses where the rural aged resides. This was done using a snow ball approach in the respective settlements selected for this research. Where there was no combination of the two (aged men and aged women), either of the two was also sufficient.

## 177 | 2.3 Statistical Analysis

178 | ~~Data obtained was analyzed using a number of analytic methods from SPSS package descriptive~~  
 179 | ~~Descriptive statistics statistics~~ (frequencies and percentages ~~and likert scale~~) was used to  
 180 | examine the socio-economic characteristics of the rural aged population. ~~,-Awareness, source of~~  
 181 | ~~awareness and perceived climate variability indicators were created using the descriptive~~  
 182 | ~~statistics (frequencies, percentages and likert scale).~~ Principal component analysis ~~through~~  
 183 | ~~Principal Component Extraction estimated from standardized indicator values~~ was used to  
 184 | determine the perception index of climate variability. ~~This was created through Principal~~  
 185 | ~~Component Extraction estimated from standardized indicator values.~~ Bi-variate Correlation  
 186 | Analysis was used to determine factors influencing perception of climate variability of the rural  
 187 | aged while Chi-Square analysis was used to determine the factors influencing awareness of  
 188 | climate variability.

## 189 | 3.0 RESULTS AND DISCUSSION

### 190 | 3.1 Socio-economic characteristics of the Aged

192 | Table 1 shows the socio-economic characteristics of the aged in selected rural settlements  
 193 | of Kanke and Riyom local government areas of Plateau State. The study revealeds that there  
 194 | were 51.8% aged males and 48.2% aged females ~~which illustrated the. This shows that there are~~  
 195 | ~~more dominance of~~ aged men ~~than aged females~~ in ~~both the~~ areas. ~~Also m~~Majority of the  
 196 | respondents (72.7%) were in the age range 60-69 years with more than 70% of the respondents  
 197 | married and about 26.6% widowed. The study also showed that 64.7% had no formal education;  
 198 | more than 30% had either primary or secondary education while 3.6% had post secondary  
 199 | education. Also, more than 80% of the respondents are crop farmers and about 3.6% of the  
 200 | respondents are retired civil servants. Majority of the respondents (62.6%) earned less than  
 201 | N20000 (56USD) per month.  
 202 |

### 203 | 3.2 Awareness of climate Variability by the Aged

204 | Table 2 revealed the analysis of the Awareness of climate Variability by the rural Aged in  
 205 | Plateau State. From the table, 86.3% said they have heard of climate change/variability; 80.6%  
 206 | felt they understood what is meant by climate change/variability; while 95% felt the pattern of  
 207 | weather is changing; 20.9% could not recall their source of information on climate change. **This**  
 208 | **indicateds** that majority of the aged in the areas are aware and understand what climate  
 209 | variability entails. **This is in line with** Falaki *et al.* (2013) and Gbetibouo (2009) **reported who**  
 210 | **noted that a** reasonable awareness of **a the** problem is the first prerequisite towards adaptation  
 211 | **and will. This will therefre** enhance their adaptation to the changing climate  
 212 |

### 213 | 3.3 Sources of Information on Climate Variability by the Aged

214 | Table 3 revealed the analysis on multiple responses of sources of information on climate  
 215 | variability by the rural aged in Plateau State. The table showed that the highest number of the  
 216 | respondents (49.6%) got the awareness from friends and neighbors; 17.3% became aware of  
 217 | climate variability from television and radio; 10.8% knew about climate change from Newspaper  
 218 | and magazine while the remaining 2.8% got theirs from Interment and government agencies.  
 219 | **However, this contradicts** Luka and Yahaya (2012) **who examined sources of awareness and**  
 220 |

Formatted: Font: Bold

Formatted: Font: Bold

221 perception of the effects of climate change among sesame producers in the southern agricultural  
 222 zone of Nasarawa State, Nigeria. From the study, it was discovered that the highest number of  
 223 respondents got their awareness from the educated farmers (83.3%), followed by 76.6% from the  
 224 extension agents (76.7%), 61.1% from radio and television, 52.2% from friends (Non farmers),  
 225 28.9% from nongovernmental organizations and 18.9% from newspapers. This means that  
 226 sources to channel climate change information must put into consideration avenues where the  
 227 target population can easily access the information.

228 **Table I: Socio-economic characteristics of the Aged**

Socio-economic characteristics	Value label	Local Government Areas		Total N=139
		Kanke N= 46	Riyom N= 93	
Gender	Male	54.3%	50.5%	51.8%
	Female	45.7%	49.5%	48.2%
Age	60-64	47.8%	47.3%	47.5%

Cannot recall source	30.4%	16.1%	20.9%

236

237 **3.4 Perception of Climate Variability by the Aged**

238 Table 4 shows Ageds' perception of climate variability.79.1% of the aged population  
 239 perceived climate variability as Flooding; this is followed by 76.3% who perceived it to be  
 240 Harmattan and Haze. 73.4% felt sees climate variability to mean heavy storm. 68.3% felt its  
 241 heavy rainfall, 66.2% perceived it to be delayed onset of rain; 60.4% sees it as short rainy  
 242 season, 56.8% perceived it as drought, while 48.9% sees it as earlier onset of rain.

243

244 **Table 4: Perception of Climate Variability by the Aged**

<b>Perceived Indicators of Climate Variability</b>	<b>Kanke N= 46</b>	<b>Riyom N= 93</b>	<b>Total N= 139</b>
Heavy Rainfall	12.9	55.4	68.3
Flood	29.4	59.7	79.1
Drought	12.9	43.9	56.8
higher temperature/heat	15.8	59.0	74.8
Delayed onset of rain	16.5	49.6	66.2
Earlier onset of rain	18.0	30.9	48.9
Short rainy season	13.7	46.8	60.4
Harmattan /Haze	19.4	56.8	76.3
Storm	16.5	56.8	73.4

245

246

247 **3.5. Creating Composite Perception Index**

248 Aged's perception of climate variability indicators (heavy rainfall, flood, drought, higher  
249 temperature and heat, delayed onset of rain, earlier onset of rain, short rainy season,  
250 harmattan/haze and storm) were converted to Composite Perception Index using Principal  
251 Component Analysis. The Perception Index was created through Principal Component  
252 Extraction estimated from standardized indicator values. This standardization was performed  
253 automatically by SPSS before running PCA. SPSS was used to generate a PCA model for the  
254 perception index. The perception index created was also in standardized form.

255 First, the perceived indicators of climate variability were input into a PCA model to  
256 detect their appropriateness for factor analysis. The outputs of the PCA model were four tables:  
257 The components matrix, the common variance, communalities table and the KMO-Barlett test.  
258 These tables were used to improve the PCA model.

259 Kaiser-Meyer-Olkin (KMO) was one of the outputs of PCA model used in the study to  
260 detect the appropriateness of carrying out a factor analysis. The higher the KMO value, the more  
261 appropriate to carry out the factor analysis of the variables. The KMO value for the study was  
262 0.874 (Table 5). The value was considered very good and also within the acceptable KMO value  
263 range. This therefore implies that factor analysis is appropriate for the study and can proceed.

**Table 5 KMO and Bartlett's Test**

Kaiser-Meyer-Olkin Measure of Sampling Adequacy.		.874
Bartlett's Test of Sphericity	Approx. Chi-Square	391.037
	Df	36
	Sig.	.000

264 Source: Author's Survey, 2017

265

266 Another test of appropriateness of the PCA model is the size of the communalities..  
 267 Higher communalities size values means greater share of common variance explained by the  
 268 extracted components while lower size values indicate smaller share of common variance  
 269 explained by the extracted components. The value of communalities ranges between 0 and 1  
 270 Table6 Shows that the communalities size. The sizes range in value from 0.117 to 0.633. This is  
 271 considered to fall within the acceptable range.

**Table 6 Communalities**

	Initial	Extraction
Heavy rainfall	1.000	.599
Floods (Frequency and intensity)	1.000	.379
More frequent drought	1.000	.444
Excessive heat/higher temperature	1.000	.479
Delayed onset of rainfall	1.000	.587
Earlier onset of rainfall	1.000	.117
Short rainy season	1.000	.518
Harmattan haze	1.000	.245
Increase in storm intensity	1.000	.633

Extraction Method: Principal Component Analysis.

Source: Author's Survey, 2017

272  
 273  
 274 The correlation matrix was used to extract the factors from the PCA model (Table 7). The  
 275 number of factors extracted was determined by the user using the eigen value rule in SPSS. Only  
 276 factors having an Eigen value of 1.0 or more were retained. Table 7 showed that only 1 factor  
 277 was revealed by this data and this accounted for 44.4% of the total variance in the data. From the  
 278 table, factor loadings; heavy rainfall, flood, drought, higher temperature/heat, delayed onset of  
 279 rain, short rainy season, harmattan/haze and storm revealed high positive loadings while earlier  
 280 onset of rain showed negative loading.

**Table 7 Component Matrix**

	Component 1
Increase in storm intensity	.795
Heavy rainfall	.774
Delayed onset of rainfall	.766
Short rainy season	.719
Excessive heat/higher temperature	.692
More frequent drought	.666
Floods (Frequency and intensity)	.616

Extraction Method: Principal Component Analysis.  
a. 1 components extracted.

300 Table 8 ( total variance explained) showed two level components of PCA with Eigen values  
301 greater 1.0 extracted using factor loading of 0.50 as the bench mark of explained common  
302 variance).The size of an Eigen value represents the amount of variance in the PCA explained by  
303 the component. Hence the larger the Eigen value, the more the component is explained by the  
304 model's indicator (Henry et al, 2003). This implies that the first two components of PCA with  
305 Eigen values greater than 1 as seen in Table 8 (total variance explained) account for high  
306 variance while those components with eigen value of less than 1 account for less variance. The  
307 total variance explained by the component extracted accounts for 44.4%. Also the cumulative  
308 percentage of variance indicated 44.4%.This shows that all variance is considered to be true and  
309 common variance.  
310

**Table 8: Total Variance Explained**

Component	Initial Eigenvalues			Extraction Sums of Squared Loadings		
	Total	% of Variance	Cumulative %	Total	% of Variance	Cumulative %

311  
312

313 After assessing the appropriateness of carrying out factor analysis, the standardized  
 314 values of the component scores were saved as “perception index” a variable in the household  
 315 data using the final version of the PCA model through the Factor Analysis dialogue box in SPSS.  
 316 The perception index created was also in standardized form.

317

### 318 3.7. Creating Composite Awareness Index

319 Aged’s awareness of climate variability indicators (heard about climate  
 320 change/variability, understand the meaning of climate variability, feel the pattern of weather is  
 321 changing) were converted to Composite Awareness Index using Principal Component Analysis.  
 322 This was created through Principal Component Extraction estimated from standardized indicator  
 323 values. This standardization was performed automatically by SPSS before running PCA. SPSS  
 324 was used to generate a PCA model for the awareness index. Indicators of climate variability  
 325 awareness were included into a PCA model to detect their appropriateness for factor analysis.  
 326 Four tables (The components matrix, the common variance, communalities table and the KMO-  
 327 Bartlett test) were gotten as the outputs of the PCA model. The KMO output of the model  
 328 indicated a value of 0.463 (Table 9). This was considered too weak for factor analysis to  
 329 proceed. However other output of the model was examined.

Table 9 KMO and Bartlett's Test

Kaiser-Meyer-Olkin Measure of Sampling Adequacy.		.463
Bartlett's Test of Sphericity	Approx. Chi-Square	16.556
	Df	3
	Sig.	.001

330 Source: Author’s Survey, 2017

331

332 The communality table is another output of the model used to test the appropriateness of  
 333 factor analysis. The value of communalities ranges between 0 and 1 Table 10 revealed that the  
 334 sizes ranged in value of 0.687 to 0.894. This is considered to fall within the acceptable range  
 335 and therefore indicated the appropriateness of factor analysis and therefore can proceed.

Table 10 Communalities

	Initial	Extraction
Heard about climate change/variability	1.000	.894
Understand what is meant by climate change/variability	1.000	.687
Think the pattern of weather is changing	1.000	.766

Extraction Method: Principal Component Analysis.

336 Source: Author’s Survey, 2017

337

338 Table 11 showed the correlation matrix which is one of the output of PCA model. The  
 339 output was also used to detect the appropriateness of factor analysis. The Table revealed that 2  
 340 factors were extracted. Using factor loading of 0.50, the first factor loadings had 2 high positive  
 341 loadings (heard about climate change/variability and understand the meaning of climate  
 342 variability). The second factor loading also showed that ‘heard about climate variability and  
 343 change’ had high positive loadings and negative loading of changing pattern of weather. This  
 344 also signified that factor analysis can proceed.

345  
 346

**Table 11 : Component Matrix<sup>a</sup>**

	Component	
	1	2
understand the meaning of climate change/variability	.828	.041
think the pattern of weather is changing	.695	-.532
Heard of climate change/variability	.390	.862

348

358 Finally, Table 12 shows the total variance explained table with two level components  
 359 having Eigen values greater than 1.0 extracted using factor loading of 0.50 as the bench mark of  
 360 explained common variance). The first two components of the table with Eigen values greater  
 361 than 1 as seen in Table 12 (total variance explained) account for high variance while those  
 362 components with Eigen value of less than 1 account for less variance. The total variance  
 363 explained by the first component extracted accounts for 43.99% of the total variance. The second  
 364 component accounts for 34.23% of the total variance. Also the cumulative percentage of  
 365 variance indicated 78.218%. This showed that all variance is considered to be true and common  
 366 variance. Therefore the factor analysis can proceed.

367

**Table 12: Total Variance Explained**

Component	Initial Eigen values			Extraction Sums of Squared Loadings		
	Total	% of Variance	Cumulative %	Total	% of Variance	Cumulative %
1	1.320	43.991	43.991	1.320	43.991	43.991
2	1.027	34.227	78.218	1.027	34.227	78.218
3	.653	21.782	100.000			

Extraction Method: Principal Component Analysis.

368  
 369

Source: Author’s Survey, 2017

370 From the assessment of the test of appropriateness of factor analysis, all the output  
 371 indicated the appropriateness of factor analysis except the KMO test which indicated otherwise  
 372 because of its weak value. However, the factor analysis still proceeded. After assessing the  
 373 appropriateness of carrying out factor analysis, the standardized values of the component scores  
 374 were saved as “Awareness index” a variable in the household data using the final version of the

375 PCA model through the Factor Analysis dialogue box in SPSS. The awareness index created was  
 376 also in standardized form.  
 377

### 378 3.8. Factors Influencing Aged's Perception of Climate Variability

379 In determining factors influencing the aged population's perception of climate variability,  
 380 perception of the Aged which is the dependent variable and Ageds' socio-economic  
 381 characteristics which are the independent variables were correlated and presented in Table 13.  
 382 Aged's perception of climate variability indicators (heavy rainfall, flood, drought, higher  
 383 temperature and heat, delayed onset of rain, earlier onset of rain, short rainy season,  
 384 harmattan/haze and storm) were first converted to Composite Perception Index using Principal  
 385 Component Analysis. Perception Index was created through Principal Component Extraction  
 386 estimated from standardized indicator values (Refer to 3.6 Section). This standardization was  
 387 performed automatically by SPSS before running PCA. The perception index created was also in  
 388 standardized form. Pearson and Spearman Correlation Coefficients were used to examine the  
 389 relationship between aged's socio-economic characteristics and their Perceptions. Pearson  
 390 correlation was used for continuous variables and spearman correlation coefficients for ordinal  
 391 variables. Results in Table 13 revealed a moderate and positive association between ageds'  
 392 perception of climate variability and local government areas ( $r= 0.347$ ,  $p = 0.000$ ). This implied  
 393 that the ageds' perception of climate variability varies with the local government areas they  
 394 reside in. This might not be far-fetched from the fact that Kanke Local government area is  
 395 lowland while Riyom Local government area is upland, which according to Sanni (2015)  
 396 revealed the fact that climate of Plateau state is dominantly influenced by its relief and may  
 397 influence respondents' perception of climate variability. The result also revealed a weak negative  
 398 relationship between the respondents perception of climate variability and their Age at ( $r = -$   
 399  $0.083$ ,  $p=0.332$ ) and also a weak but positive relationship with Income at ( $r = 0.080$ ,  $p=0.347$ ).  
 400 This means, the higher the age of the aged, the lower their level of perception and the higher  
 401 their income the higher is their level of perception. However, gender, marital status, educational  
 402 status and occupation did not present a meaningful relationship. Therefore they are taken not to  
 403 be major determinant of perception of climate variability by the aged in Plateau State, Nigeria.

404 **Table 13: Correlation between Socio-Economic Characteristics and Ageds' Perception of**  
 405 **Climate Variability**

Variable 1	Variable 2	Correlation coefficient	Coefficient	P-Value	Mean	Standard Deviation
Age	Aged's perception	Pearson	-0.083	0.0332	1.99	1.192
Income	Aged's perception	Pearson	0.080w	0.347	1.66	1.018
Local Govt Area	Aged's perception	Spearman	0.347**	0.000	4.67	0.472
Gender	Aged's perception	Spearman	-0.012	0.893	1.48	0.501
Marital Status	Aged's perception	Spearman	0.007	0.938	1.58	0.909
Educational Status	Aged's perception	Spearman	-0.003	0.972	1.52	0.871

Occupation	Aged's perception	Spearman	-0.024	0.776	1.46	1.331
------------	-------------------	----------	--------	-------	------	-------

### 407 3.9. Chi-square Table of Relationship between Socio-economic Characteristics and Ageds' 408 Awareness of Climate Variability

409 Age, income, local government areas, gender, marital status, educational status and  
410 occupation were examined to determine their influence on ageds' awareness of climate  
411 variability. First, aged's awareness of climate variability variables (heard about climate  
412 change/variability, understand the meaning of climate variability and thinking the parttern of  
413 climate is changing) were first converted to Composite Awareness Index using Principal  
414 Component Analysis. The Awareness Index was created through Principal Component  
415 Extraction estimated from standardized indicator values (Refer to 3.7 Section). Then, chi-square  
416 analysis was done between socioeconomic characteristics and the awareness index created.  
417 Result of chi-square analysis is presented in Table 14. The Table revealed that there were  
418 positive and significant relationships between awareness of climate variability index and the  
419 listed socio-economic variables namely: Marital status ( $X^2 = 113.44$ ;  $p < 0.05$ ) and Occupation  
420 ( $X^2 = 151.570$ ;  $p < 0.05$ ). From the analysis, it can be stated that marital status and occupation are  
421 major determinants of the aged awareness of climate variability. However, Age ( $X^2 = 27.616$ ;  
422  $p > 0.05$ ), Income ( $X^2 = 21.435$ ;  $p > 0.05$ ), Gender ( $X^2 = 14.847$ ;  $p > 0.05$ ), Educational Status ( $X^2$   
423  $= 59.075$ ;  $p > 0.05$ ) and Local government Area ( $X^2 = 11.443$ ;  $p > 0.05$ ) were found to be positive  
424 but have no significant relationship with awareness of climate variability. This implies the ageds'  
425 age, income, gender, educational status and local government area are not determinant of their  
426 awareness of climate variability.

427 **Table 14: Chi-square Table of Relationship between Socio-economic Characteristics and**  
428 **Ageds' Awareness of Climate Variability**

Variable	X <sup>2</sup>	DF	level of Significance
Age	27.616	40	0.931
Income	21.435	30	0.870
Local Govt Area	11.443	10	0.324
Gender	14.847	10	0.138
Marital Status	113.444	30	0.000
Educational Status	59.075	50	0.178
Occupation	151.570	50	0.000

430

### 431 Conclusion and Recommendation

432 Climate variability is perceived differently by different people and this perception is  
433 based on their observations and experiences of rainfall and temperature patterns. Awareness and  
434 perception of Climate variability especially by the rural aged is very important. A good  
435 knowledge and understanding of climate change and variability will enable appropriate response

436 to its impact. From this study, majority of the rural aged in the region are aware of climate  
 437 change/variability and many of them got the awareness from friends, neighbours, television and  
 438 radio. The study also revealed they understood climate change/variability and felt the pattern of  
 439 weather is changing. Their understanding and perception of the reality of climate change will  
 440 help in their adaptation to the challenges of climate change

441 Result also indicated that local government area is a major determinant of the ageds'  
 442 perception of climate variability. For instance, Kanke local government area is upland while  
 443 Riyom Local government is lowland, therefore their perception of climate variability in the two  
 444 local government areas will be different due to the peculiarity of the location of the local  
 445 government areas. Therefore for effective intervention and response to climate change and  
 446 variability awareness and perception, socio-economic characteristics of the people and  
 447 peculiarities of the areas must be taken into consideration.
