2 **THE USE OF INSTRUCTIONAL RESOURCES IN**

3 **SCIENCE EDUCATION: ISSUES AND CHALLENGES**

4

5 **Abstract**

6 *This paper discusses the issues and challenges of instructional resources for teaching and learning*
7 *science in Nigeria secondary schools. The concept of instructional resources was treated as well as*
8 *the relevance of availability and proper usage of instructional resources. The instructional*
9 *resources discussed in this study were basically material and human resources. The human*
10 *resources are laboratory staff. The material resources treated among others include: the classroom,*
11 *the laboratory, library, equipment, models and charts, curriculum and science textbook. The issue of*
12 *inadequacy and lack of these resources in most secondary schools were discussed. The work also*
13 *examined the instructional resources and the science teacher. The study concluded that science*
14 *should be learnt in a way that will equip our students with such attributes as creativity,*
15 *resourcefulness and manipulative skills in this way it could be meaningful to the learner and also*
16 *help in the development of entrepreneurial skills for self-reliance. It was therefore, recommended*
17 *that stakeholders in science education should provider enough funds to build more classrooms,*
18 *laboratories and provide the equipment and resources for the teaching and learning of science,*
19 *libraries should be provided with modern quality science textbooks for teachers and students and*
20 *government should make available adequate fund for provision of instructional resources for*
21 *teaching science.*

22

24

25 **Introduction**

26 In any academic environment there are facilities that can contribute in no small measure to
27 teaching and learning process. Science is a body of knowledge comprising of ideas, Skills, and
28 information about the world, nature and man. According to Mbah and Leghara (2008), Science is a
29 two-activity that involves product (the knowledge and other outcomes of science) and process (the
30 skills and scientific procedures of investigation). It is an embodiment of attitude of inquiry,
31 observation and reasoning with respect to the world. It is usually developed through practice,
32 observation and reasoning. For learning to take place learners must have access to necessary
33 information, materials and resources. Due to the nature of science, teaching and learning of science
34 subjects cannot be facilitated without availability and usage of some resources.

education in general and science education in particular.

36 Resources in education encompasses all persons and things capable of conveying information,
37 values, processes, experiences and techniques that can be used to actively engage learners in the
38 learning process. The teaching and learning of the science (physics, chemistry and biology)
39 including basic science and technology at the secondary school level require diverse human and
40 material resources.

41 Lack of ideal resources for science teaching and learning in Nigerian secondary schools in
42 particular has been a major issue of concern. It is a well-known fact that the quality of education a
43 student receives largely depends on the quality of teaching/learning resources provided. Teaching
44 learning resources are all the things used by the teacher during teaching to aid understanding and
45 make teaching successful and effective. These resources are broadly grouped into two namely,
46 material and human resources according to Adeyemo (2010). The material resources include: the
47 classroom, the laboratory, library, equipment, models and charts, curriculum and science textbooks.
48 The human resources include qualified science teacher and laboratory personnel (laboratory staff).

49 **Concept of Science Learning and Teaching**

50 Science teaching is concerned with sharing science content and process with individuals who
51 are not traditionally considered to be member of the scientific community, the individuals could be
52 students, farmers or a whole community (Abdullahi, 2013). Science teaching includes work in
53 science content, science process, some social science and some teaching pedagogy. The standards
54 for science education provide expectations for the development of understanding for students
55 through the entire course of study and beyond.

56 **Concept Scientific Development**

57 According to Abdullahi (2013), Science is a process as well as knowledge. Children learn
58 science by being involved not only with its contents, but also with its methodology. The effective
59 science facility accommodates both. Science study requires a variety of unique instructional

common to education. A science facility must have space to
ation with hands-on instructional strategies. Science

62 instructional areas have spatial and material needs that are different from those considered in
63 designing a general classroom. As early as possible, students need to become acquainted with the
64 nature of science and the processes of science. It is imperative that all students have a full science
65 education experience starting in kindergarten, and that an increasing number of students pursue
66 science education throughout their high school years and beyond .

67 Science education deals with sharing of science content and process with individuals who are
68 not considered traditionally to be member of the scientific community; the individuals could be
69 students, farmers, market women or a whole community (Wudil, 2017). Science education in
70 Nigeria concentrates on the teaching of science concepts, methods of teaching and addressing
71 misconceptions held by learner regarding science concepts. Science education is very important to
72 the development of any nation and that is why every nation must take it very serious in all
73 institutions of learning. Many of the developed nations were able to achieve so much in science and
74 technology because of science education.

75 Despite all the great things science education can accomplished in the national development
76 of a nation there are many problems militating against it especially in Nigeria. Science education is
77 very important to the development of any nation in many areas. A graduate of physics education can
78 be self-employed as opined by who of the physics graduates have some knowledge of electronics
79 that is enough for them to be able to have a little period of training as apprentices and then stand
80 alone as electronic technician. For instance, semiconductor physics is very important in the modern
81 technology that if properly learnt it is enough for one to stand upon for a living, semiconductor
82 physics is part of what any graduate in physics will learn and should learn. In semiconductor, is very
83 important in a growing economy like ours in Nigeria; it is useful in ceramic industry and a well-
84 trained physics education graduate can be well established in ceramic industry. Without science
85 education Information and Communication Technology would be impossible.

86 Science and technology will be impossible without science education; for instance
87 engineering, medicine, architecture etc will not be possible if there is no one to teach the students the
88 core subjects needed for these course. Biology education is very important to any growing economy
89 like Nigeria. Many graduates of biology education are self-employed and employers of labour, many
90 owned schools for themselves where people work and earn their living while some are in to fish
91 business. There are colleges of education where students of chemistry department are taught how to

Departments can establish their own chalk business as soon
many schools do not need to buy chalk outside anymore and

94 they can equally produce for other schools.

95 One specific focus of science education may be one of simply learning facts by note, science
96 education in recent history also generally concentrates on the teaching of science concepts and
97 addressing misconceptions that learners may hold regarding science concepts or other contents.
98 Science education has been strongly influenced by constructivist thinking (Eriba, 2012).

99 Constructivism in science teaching has been informed by an extensive research programme
100 into students thinking and learning in science, and in particular exploring how teachers can facilitate
101 conceptual change towards canonical scientific thinking (Ada, 2016). Constructivism emphasizes
102 the active role of the learner, and the significance of current knowledge and understanding in
103 mediating learning, and the importance of teaching that provides an optimal level of guidance to
104 learners (Pierre, 2014).

105 In an attempt to make science teaching effective and relevant for a large and necessarily
106 more diverse of the population, there is need to transform how learners think so that they can
107 understand and use science like scientists do.

108 **Meaning of Instructional Resources**

109 Instructional resources according to Jatau and Jatau (2008) are different kinds of materials the
110 teacher and the entire class use in teaching and learning process so as to make it more effective and
111 productive. Makori and Onderi (2014) considered it as things which are to help teachers to teach
112 more effectively. In this context, resources were conceptualized as devices that contribute to
113 effective science delivery and learning by the teacher and the learners respectively to achieve
114 specific goal and general goal of science education.

115 **Availability and Suitability of Instructional Resources in Teaching and Learning process**

ources in teaching and learning process as identified by

117 Taylor and Rasheed (2017), include:

- 118 i. It helps to increase teacher's competence.
- 119 ii. It enhances the learning and retention of knowledge and skills.
- 120 iii. It helps to arrest and sustains learner's attention.
- 121 iv. It encourages development of scientific terms and communication skills
- 122 v. It helps to motivate learners.
- 123 vi. It helps to make learning more concrete and real.
- 124 vii. It stimulates problem solving and finally makes it easy to relate different pedagogical
- 125 strategies.
- 126 viii. It encourages participatory learning.
- 127 ix. It reduces teachers stress by making teaching and learning easy and more interesting.
- 128

129 **Types of Instructional Resources**

130 According to Kibirige and Hodi (2015) some of the instructional resources use for
131 science teaching includes:

132 **Laboratories**

133 Science is experimental and so is learnt by doing. Experimentation in science is
134 sorely dependent on the availability of science equipment/materials for proper understanding,
135 development and application. Ugwu (2008) maintains that lack of adequate laboratory
136 facilities is a common feature in most of our secondary schools. Students rarely have hands-
137 on, minds-on activities science practical is better done in the laboratory but most schools lack
138 there important resources for teachers demonstration to students.

139 **Library**

140 The benefits of a functional and/or good library system are enormous and include the
141 provision of access to books and other reading materials or resources. The immediate benefit
142 of access to reading resources is the promotion of reading culture which in turn underpins the

cy skills. The ability of the academic library to provide the

144 available learning resources is being continually undermined and called into question. In
145 spite of the fact that library is the supportive input for an academic institutions for teaching,
146 learning and research. It is observed that various institutions managements are not providing
147 adequate library resources for their institutions, and also in some places where these
148 resources are available: they are not put into maximum use (Iortim & Atagher, 2013).

149 Majority of students do not have textbooks and most of the schools do not have libraries and
150 where they have one, the textbooks in the libraries are outdated.

151 **Physical Environment (Classroom)**

152 Quality physical environment is very important because it can significantly affect
153 student achievement. Lack essential infrastructure makes learning environment must be
154 adequate and conducive.

155 **Science Textbooks**

156 The importance of relevant science textbooks in the teaching and learning process of
157 science has been widely recognized in the literature. The textbooks provide structure and
158 order in the teaching and learning process and in the classroom, they are considered as useful
159 and effective tools or instruments whose purpose is to facilitate the work of the teacher on a
160 daily basis. Textbooks give students stability and confidence. Science textbooks also provide
161 security and confidence to inexperienced teachers. Unfortunately, secondary schools in
162 Nigeria are associated with lack or shortage of relevant science textbook for science
163 curriculum implementation especially when new curriculum is introduced in schools.

164 **Other Teaching Resources (Materials)**

165 Other instructional resources include:

- 166 • Visuals-charts, photograph, slides, posters, models, real objects, etc.

strip, television, video, etc

168 • Static display-chalk board, flannel graph, etc

169 • Electronic-radio, email, computer, etc.

170 **Human Resources Available for Science Teaching**

171 Human resources in this context are the laboratory staff. In a standard laboratory,
172 provision should be made for laboratory staff such as laboratory technicians/laboratory
173 technologist. They constitute a vital component of the teaching force. But the most
174 unfortunate thing with our education system is that, school administrators are yet to see the
175 need for these all-important support staff for effective teaching of not only integrated science
176 alone but all the sciences. This lukewarm attitude of school administrators towards their
177 employment has often put a lot of burden on the teacher: this category of support staff
178 usually renders useful assistance for the science teachers in effective handling of his or her
179 lesson. The absence of qualified/laboratory technicians in most of our schools can make the
180 job of the teacher of science very difficult, but as the situations are now, the science teacher
181 has to cope with the problem.

182 Most school systems do employ laboratory assistants or attendants to help the science
183 teachers. The problem with such assistants or attendants is that most of them are not specially
184 trained to work in a laboratory. It is then expected that the teacher should take up the
185 responsibility of training such support staff anytime they are employed to assist him or her.

186 The science teacher should also make laboratory 'assistant' or attendant to be
187 interested in science. It is also the responsibility of the science teacher to recommend his
188 untrained laboratory assistants for the many in-service courses.

189 **Instructional Resources and Science Teacher**

191 Resources for teaching science are irrelevant and valueless except are properly
192 utilized by science teacher. In other words, the usefulness of instructional resources depends
193 on what the teacher makes out of them. It is necessary therefore, that the science teacher
194 should skillfully and intelligently handle and use these resources for them to serve the desired
195 purpose. If not, it can hinder meaningful learning consequently; the science teacher should
196 have a basic knowledge and skill on how to make use of the necessary instructional resources.
197 One of the reasons why some science teachers avoid the use of some available instructional
198 resources for teaching is because many of them lack the basic knowledge and skills to
199 operate them (Eriba, 2012; Wudil, 2017 Ankeli, 2018).

199 **Conclusion**

200 Effective teaching and learning of science requires adequate resources such as
201 classrooms, laboratories, textbooks, charts, models and consumables like chemicals and
202 reagents for the teachers to engage students in practical and activity work. Unfortunately,
203 most of these resources are either lacking or inadequately provided for secondary schools.
204 Urgent step is therefore needed to provide sufficient material resources for teaching the
205 science subjects in order to realize the goals of science education in Nigeria secondary
206 schools.

207 For science education to be important in the development of our nation, it should
208 equip our students with such attributes as scientific enquiry, power of observation, and
209 mastery of manipulative skills, creativity resourcefulness, and mechanical comprehension. It
210 should translate from why of science to know-how, be activity oriented and relate to the
211 environment. Science taught and learnt in this way could be meaningful to the learner and also
212 help in the development of entrepreneurial skills for self reliance. The teaching of science
213 mainly for the acquisition of knowledge has lead to the development of passivity, docile

214 learning and dependency on teachers and text books, instead of active learning in which
215 teachers and text book are challenged. As bedrock of economic growth, one can say without
216 fear of contradiction that the only way out of our problem of underdevelopment is through
217 the provision and use of science equipment by students and also allocation of adequate time
218 for science practical. It is one of the effective routes out of stagnation through the
219 development of capabilities in science education.

221 **Recommendations**

222 In view of the relevance of instructional resources in science teaching and learning
223 process and the problem of lack/inadequate provision of these resources, it is therefore
224 recommended that;

- 225 1. The stakeholders in science education should provide enough funds to build more
226 classrooms, laboratories and provide the equipment and resources for the teaching and
227 learning of science.
- 228 2. Government should provide adequate funds to schools for procurement of material
229 resources.
- 230 3. Libraries should be provided with modern relevant quality science textbooks for teachers
231 and students.
- 232 4. all tertiary teachers training institutions and the department of education of the
233 universities should have resource centers for training and retraining of teachers to enable
234 them acquire knowledge and develop basic skills necessary to use the instructional
235 resources.
