I read with interest the manuscript entitled: '**Expression of PDCD1 (PD-1) Geneamong non-small cell lungcancer (NSCLC) Patients with Real-Time PCR application'.**

However there are some points to address:

1) The legends of figures are incomplete. Each table or figure should be understandable even without consulting the text.

2) The sample size is too small and will be difficult to do any statistical analyses with these results.

3) the frequency of expression of the gene in patients (Fig 1) has no control. This must be included. If not indicated.

4) In Fig 2. What do the different colors of the temperature curve indicate. It needs a legend. Fig 2 has be be labelled as A and B each of which should have a legend.

5) Nothing is said on the role of the 22 various grades of disease determined. Why go for these grades?. The literature review is insufficient.

6) It must be shown that the expression of the house keeping gene is the same in all samples. This is not shown.

Conclusion:

The above points must be addressed before the paper can be published.
