

Editor's Comment:

Considering all points raised, we may certainly agree with the authors regarding items 1 to 4 but, items 5 and 6 are the most relevant and neglected.

Note that, without such explanations, it becomes impossible to attribute the CN- removal to the solid phase used, since relevant volatilization could occur (Find enclosed a reference discussing these in deeper)..

Moreover, such basic concerns regarding fundamental chemistry, as well as safety, are at least mandatory.

In such sense I am regret to inform that, in my opinion, the proposed paper is not suitable for publication.
