

# Effect of Locally Formulated Watermelon and *Moringa* Syrup Booster on the Growth Performance of *Heterobranchus bidorsalis* Fingerlings

## ABSTRACT

**Aim:** Evaluation of the effectiveness of formulated Watermelon (*Citrullus lanatus*) and *Moringa oleifera* booster on the growth performance of *Heterobranchus bidorsalis*.

**Study design:** This paper has Experimental design; data were subjected to statistical analysis using Duncan Multiple Range Statistics and interpretation was done using SPSS Version 22.

**Place and duration of study:** The experiment was conducted in the laboratory at the Department of Applied and Environmental Biology, Rivers State University, Nigeria for a period of 12 weeks (3 months), between November, 2016 – March, 2017.

**Methodology:** Total of 240 *Heterobranchus bidorsalis* fingerlings with an initial mean weight ( $1.61 \pm 0.23$ g) and length ( $5.13 \pm 0.26$ cm) were acclimated for one week. After acclimation, the fishes were fed twice daily (9am and 6pm) with 10% of their body weight after coating 2ml/1kg of the commercial feed with their individual growth booster syrup and allowed to air-dry for about 20 minutes. *Heterobranchus bidorsalis* fingerlings were scooped for the measurements exercise at one week interval after which they were returned to their various tanks.

**Results:** The result of this study recorded the experimental diets with optimum growth and survivability. From the result, it was deduced that, Commercial feed coated with watermelon syrup booster recorded the best performance in the growth variables of mean weight ( $26.36 \pm 3.19$ g), mean length ( $13.61 \pm 1.35$ cm), mean weight gain ( $24.64 \pm 3.00$ g), mean length gain ( $8.38 \pm 1.35$ cm), relative weight gain ( $25.36 \pm 3.19$ ) while Commercial feed coated with commercial syrup booster (CbCf) recorded the best performance in growth variables of Daily Growth Rate ( $15.15 \pm 0.55$ ) and Specific Growth Rate ( $2.69 \pm 0.03\%$ ) against *Moringa* growth booster and commercial feed (control). However, there was less mortality as the fishes in different treatment tanks survived above 90%.

**Conclusion:** It could be summarized that Commercial feed coated with watermelon syrup booster (WbCf) had the best growth performance against the control groups although their values were not significantly impacted ( $p > 0.05$ ) when compared with other experimental diets.

## 1. INTRODUCTION

19  
20  
21  
22  
23

Aquaculture is a practice used all over the world, especially in some African Countries; millions of people practice aquaculture and have used it immensely in ancient times as their means of livelihood [6]. Fish rearing/ Aquaculture practices needs less labor input compared to other agricultural practices and the expected profit margin when properly maintained is usually on the high side. For a small scale fish farmer who wishes to culture *Heterobranchus*

24 *bidorsalis*, the fluctuating level of ingredients contained in commercial feed becomes a barrier.  
25 This necessitates an innovative approach in utilizing an available formulated extract from  
26 watermelon and *Moringa* growth booster to enhance the nutrients contained in the feed [7].  
27 Watermelon and moringa contains vital nutrients which includes vitamins, minerals, essential  
28 amino acid, phytochemicals such as carotenoids of which includes lycopene, Beta carotene,  
29 lutein. Lycopene and Beta carotene are strong antioxidant that can help to protect the cell  
30 against oxidative damage and therefore reduce risk of degenerative diseases caused by free  
31 radicals [14, 5]

32 Growth boosters are effective growth promoters, formulated to supplement balance feed and  
33 digestion in the target organism. Growth boosters are classified as Acidifiers, probiotics,  
34 synbiotics, phytogenics, feed enzymes and immune stimulants. Watermelon and *Moringa*  
35 syrup booster are categorized under phytogenics [10, 16].

36 Phytogenics are gotten from herbs, spices, aromatic plant etc. They are agents of microbes,  
37 fungi, virus, oxidation etc, aid in digestion as such, increase the palatability of feed and  
38 activate endogenous digestive enzymes, they are said to play major roles on the gut  
39 microflora [16]. Given the level of production of both crops by local farmers especially in  
40 Nigeria, bolstered by the enhanced awareness of the nutritional value of both plant products,  
41 there is the opportunity to incorporate this product into preparation of high energy level fish  
42 booster for enhanced productivity of catfish.

43 According to [7], *Heterobranchus bidorsalis*, which belongs to the *Clariidea* family, can be  
44 reared on formulated and less expensive feed. The *Clariidea* can withstand unfavorable and  
45 harsh environmental condition; they thrive in low oxygen and pH environment [8]. The  
46 inadequacy of nutritive fish feed ingredients has been a major constraint to the survival of fish  
47 culture in the competitive global food production system [2], as such, fish nutrition experts  
48 world over have considered the need to review a natural growth promoter especially from  
49 plant source to boost growth performance in fish farming [4]. On this note, plant products  
50 comprising *Moringa oleifera* leave as well as Watermelon (*Citrullus lanatus*) were been  
51 considered.

52 *Moringa oleifera* which belongs to the *Moringaceae* family is said to have originated from  
53 southern foothills of the Himalayas in northwestern India. It is generally planted in tropical and  
54 subtropical areas where its young seed pods and leaves are eaten as vegetables. Various  
55 parts of *Moringa oleifera* contain some important minerals, essential amino acids, such as  
56 methionine, cystine, tryptophan [3], it is also a good sources of energy, protein, vitamins,  
57 carotene, and phenolics. *Moringa* is said to have peculiar functions which is essential to  
58 human, animal, aquatic lives etc. Considering the benefits (nutritional and medicinal) of  
59 *Moringa oleifera*, it has been promoted as a "healthful" food, traditionally used to fight some  
60 popular ailments. Watermelon (*Citrullus lanatus*) is becoming an everyday fruit like apples,  
61 bananas and oranges because of its usefulness and antioxidant properties. Watermelon was  
62 also considered because its rind and seed are not usually consumed with the whole fruit, the  
63 pulp is the major parts been consumed especially in Nigeria. This fact adds to the increase of

64 solid food waste responsibility. To prevent agricultural health related hazards, some  
65 measures like the utilization of watermelon rind and seed as a growth booster were  
66 considered.

67

## 68 **2. MATERIALS AND METHOD/ EXPERIMENTAL DETAILS/ METHODOLOGY**

69 This research was carried out in the laboratory at the Department of Applied and  
70 Environmental Biology, Rivers State University located at Longitude 4.799° N and Latitude  
71 6.983° S, Rivers State, Nigeria.

72

### 73 **2.1 Materials**

74 *Heterobranchus bidorsalis* fingerlings, Commercial feed (skretting of different variables, 1mm,  
75 1.8mm and 2.5mm) table 1, *Moringa oleifera* leaves, watermelon seed, rind and pulp,  
76 commercial booster (leegrow Tab.2), triple beam balance (OHAUS), scoop net, masking tape,  
77 meter rule (cm) and twelve plastic tanks (30litre each).

78

### 79 **2.2 *Moringa oleifera* syrup booster formulation**

80 Fresh *Moringa oleifera* leaves used for this study were harvested from the Departmental  
81 garden at Rivers State University, Rivers state Nigeria while other raw materials were  
82 purchased from Ugo Resource and Health Farm Limited in Delta State Nigeria. The leaves  
83 were sorted out, washed thoroughly, spread on a tray with evenly spaced openings. The  
84 leaves were air-dried under shade at the laboratory for 3 days. After drying, the leaves were  
85 thoroughly blended in a fine powdery form. 20% of the blended *Moringa* leaf was mixed with  
86 20% distilled water, 50% sucrose base and enzyme (binder), 10% of vitamin and mineral  
87 premix. The proximate content of the aqueous extract was analyzed for Moisture, Ash,  
88 Protein, Fats and Carbohydrates (see Table 2).

89

### 90 **2.3 Watermelon syrup booster formulation**

91

92 Watermelon fruits were bought and brought to the Research Laboratory at the Department of  
93 Applied and Environmental Biology, Rivers State University, Rivers State Nigeria. It was  
94 properly washed and sliced, seeds were picked out, rind was carefully scraped and chopped,  
95 and pulp obtained. 60% of Watermelon (pulp, rind and seed) was thoroughly blended and  
96 mixed with 30% sucrose base and feed enzyme (binder) and 10% of vitamin and mineral  
97 premix were used in watermelon growth booster formulation. The proximate content of the  
98 formulated Booster were analyzed as (see Table 2).

Total of two hundred and forty (240) *Heterocbranchus bidorsalis* fingerlings (mean weight,  $1.65 \pm 0.23\text{g}$ ; mean length  $5.13 \pm 0.26\text{cm}$ ) were obtained from National Institute of Marine and Oceanographic Research, Sapele branch in Delta State Nigeria (NIOMOR). The fishes were transported in a transparent aquarium to the experimental laboratory, Rivers State University, Rivers State, Nigeria. The fishes were put into a transparent aquarium and taken to the laboratory. *Heterobranchnus bidorsalis* fingerlings were evenly distributed into twelve plastic tanks (30litres each) at a stocking density of 20 fingerlings per tank. They were acclimated for one week during which they were placed on a maintenance diet with a commercial feed (skretting) once daily at 3% of their body weight. Water lettuce was introduced in the setup to enhance acclimation.

## 2.5 Experimental Procedures

After acclimation, twelve plastic tanks (30litre each) were randomly arranged and labeled into 4 Treatments (T. 1, 2, 3 and 4) with two replicates (R1, 2) and (R1, 2).

**T1-** Commercial booster with commercial feed (**CbCf**) - positive control.

**T2-** Commercial feed only (**Cf**) - Negative control.

**T3-** Watermelom booster with commercial feed (**WbCf**)

**T4-** *Moringa oleifera* booster with commercial feed (**MbCf**)

Fingerlings were weighed and measured to determine its initial mean weight and length. The fishes were fed twice daily (9am and 6pm) with 10% of their body weight after coating 2ml/1kg of the commercial feed with their individual growth booster syrup and allowed to air-dry for about 20 minutes.

Water was siphoned from each treatment tank daily and refilled from the tap maintaining its original water volume (25 liter). Weekly mean weight of the fishes in each labeled plastic tank were taken (to the nearest 0.01g) with OHAUS Triple Beam Balance (2610 g), weekly mean length from individual standard lengths of the fishes in each labeled plastic tank were also recorded (to the nearest 0.1cm) with a meter rule.

*Heterobranchnus bidorsalis* fingerlings were scooped for the measurements exercise at one week interval after which they were returned to their various tanks. Growth performance was determined and were recorded followed by the observation period of three months (Nov 2016-Feb 2017).

## 2.6 Monitoring of Physico-chemical Parameters

Temperature and pH values were measured daily using glass thermometer and pH kit respectively. Other physico-chemical parameters were obtained using Extech instrument (DO 700) from Institute of Pollution Studies (IPS) RSU and the values obtained were recorded in Table 3.

## 2.7 Growth parameters

Growth performance, condition factor and survivability were calculated as follows;

(a) Initial Mean Weight = (g / fish)

(b) Final Mean Weight = (g / fish)

(c) Initial Mean Length = (cm / fish)

(d) Final Mean Length = (cm / fish)

(e) Mean Weight Gain (g) =  $W1 - W0$  (Where  $W1$ =Final Weight,  $W0$ =Initial Weight)

(f) Mean Length Gain (cm) =  $L1 - L0$  (Where  $L1$ =Final Length,  $L0$ =Initial Length)

(g) Daily Growth Rate (g) =  $\frac{\text{Mean Weight Gain (g)}}{\text{Initial Body Weight (g)}}$

(h) Relative Weight Gain (g) =  $\frac{W1 - W0}{W0}$  (g) (Where  $W1$ =Final Weight,  $W0$ =Initial Weight)

(i) Specific Growth Rate =  $\frac{\ln(W1) - \ln(W0)}{T} * 100$

(Where  $\ln$ = Log e Final Weight- Log e Initial Weight, T= Culture period)

## 2.8 Statistical Analysis

Data generated were subjected to one way analysis of variance (ANOVA) with Duncan's Multiple Range Descriptive Test (Duncan, 1995). The result computation was done using Statistical Package for Social Science (SPSS) version 22. Differences among mean were separated with Turkey HSD (Honest Significant Difference) at  $p < 0.05$ .

178 **3. RESULTS AND DISCUSSION**

189 Table 2 showed the proximate analysis of *Moringa*, watermelon and commercial syrup  
 190 booster. This result showed that the moisture content in *Moringa* was significantly higher  
 191 ( $P=.05$ ) than that of the control (commercial syrup booster) and watermelon syrup  
 192 booster. Comparing proximate composition variables of Ash and crude protein content of  
 193 the growth boosters, the control (commercial syrup booster) showed a significantly higher  
 194 ( $P=.05$ ) result against *Moringa* and watermelon booster. Fats content of commercial syrup  
 195 booster is significantly lower ( $P=.05$ ) than that of *Moringa* and watermelon syrup growth  
 196 booster. Carbohydrate is significantly higher ( $P=.05$ ) in commercial syrup booster  
 197 followed by watermelon and *Moringa* has the least.

Salinity (%)	0.05
BOD (mg/l)	3.45
Turbidity (NTU)	1.06
Total Dissolved Solid (mg/l)	60

Figure 1 showed mean weight of *Heterobranchus bidorsalis* fed different experimental. Commercial feed coated with watermelon syrup booster (WbCf) recorded the highest mean weight followed by commercial feed coated with commercial syrup booster (CbCf) positive control. Commercial feed (Cf) negative control also recorded gradual increase in mean weight. Commercial feed coated with *Moringa* syrup booster (WbCf) had the least mean weight. There was gradual increase in mean weight in all the experimental diet from week 1 to 8, week 9 to 12 recorded a significantly higher (P=.05) weight increase.

256

257 Figure 3 showed Mean weight gain of *Heterobranchus bidorsalis* fed different experimental diets.  
 258 From this figure, Commercial feed coated with watermelon syrup booster (WbCf) recorded the highest  
 259 mean weight gain, followed by commercial feed only (negative control). Commercial feed coated with  
 260 commercial syrup booster (CbCf) and *Moringa* syrup booster (MbCf) had the least mean weight gain.  
 261 The increase in mean weight gain of all the experimental diets from week 1-8 was not significantly  
 262 impacted ( $P=.05$ ). There was significant different ( $P=.05$ ) from week 8-12 as such, a sharp increase in  
 263 weight gain was recorded.

264

Key: CbCf Commercial feed coated with commercial syrup booster  
Cf Commercial feed only  
WbCf Commercial feed coated with watermelon syrup booster  
MbCf Commercial feed coated with *moringa* syrup booster

The use of formulated syrup booster from watermelon and *Moringa* coated with commercial feed has revealed that, *Heterobranchus bidorsalis* fed with the experimental diet CbCf, Cf recorded no significant difference (P=.05) in growth variables. Experimental diets of commercial feed coated with watermelon syrup booster WbCf had the highest Final Mean Weight (26.36±3.19g) and Length (13.61±1.35cm) when compared with other experimental diets: CbCf (25.26 ± 0.76g, 12.88 ± 0.33cm), Cf (25.76 ± 2.77g, 13.44 ± 0.89cm). MbCf had the lowest value (23.79 ± 1.64g, 12.05 ± 0.28cm) in final mean weight and length. The calculated Digestible Energy level of the three booster used were (256.10 kcal /kg) for WbCf, *Moringa* Growth Booster (211.17 kcal/kg) and (312.23 kcal/kg) for CbCf. In contrast to the present findings, high percentage in carbohydrates (62.66 and 51.24%) from proximate analysis of the growth boosters (watermelon and *Moringa oleifera*) (Table 2) is not comparable with the result obtained from United State Department of Agriculture, National Nutrient Data base USDA (2016) [15] on *Moringa oleifera* and watermelon (8.28 and 7.55g) but justifies Carbohydrates as an important non-protein energy source for fish and should be included in the diet at an appropriate level to maximize the use of dietary protein for growth and to facilitate movement of nutrient at the Gastro Intestinal Tract (GIT) which supports nutrient absorption [10].

Commercial feed coated with watermelon syrup booster showed poor performance on Daily Growth Rate (DGR) (14.37±0.76) while commercial feed coated with commercial syrup booster CbCf had the highest value on variables of DGR (15.15±0.55%), Specific Growth Rate (2.69±0.03%), but the values were not significantly different at P>0.05 when compared to other experimental diets. The poor growth performance from the experimental diets commercial feed coated with *Moringa* syrup booster MbCF is similar with that of [2], who reported that, at more than 10% concentration of *Moringa oleifera* inclusion in feed meal, the bitter taste of saponin and phenol becomes obvious, as such, causing low feed intake which invariably affects growth response.

This crude protein level in CbCf is contrary to the report of [4]. They recorded higher crude protein level in feed additives (Aqua pro) for African catfish. With this results, it can be said that watermelon syrup booster recorded the highest value in most of the growth variables although comparing with other experimental diets, the values were not significantly impacted (P=.05).

## CONCLUSION

383 From the overall observations, this research has revealed Watermelon growth booster be a promising  
384 fish feed supplement having shown the highest growth performance. According to [4], a lot of  
385 literatures exist on other growth booster (Aqua booster, Aqua pro, Leegrow) unlike that of *Citrullus*  
386 *lanatus* and *Moringa oleifera* as a fish growth booster. As such, fish farmers should look inward on the  
387 utilization of watermelon growth syrup booster for effective growth performance of catfish, also for the  
388 more accessible cost and within a policy of green circular economy that aims at food waste recover.
