

Editor's Comment:

I have read the manuscript and authors responses. I still find significant problems with the determination of carbohydrates.

1. In the first version the concentration of sucrose was reaching a number of 197, but now such a number does not exist. What was wrong?
2. The concentrations provided this time is several fold lower than that found in the literature.
3. The TSS after storage reach almost 30% while carbohydrates only 0.1% approximately.

There are significant and serious problems with the quantification of these parameters here and I urge that authors to look for assistance in calculating the concentration of carbohydrates.
