

**Editor's Comment:**

In my opinion the below mentioned article is interested but it is not acceptable for publication in the Journal of Advances in Microbiology in actual revised version 1. The most important problem is lacking statistical analysis of the obtained results that makes those results not reliable, as without statistical analysis with use of appropriate tests (Microsoft Excel™ 2016 is not a tool for evaluation of statistical significance of differences between mean values and percentages for particular data) the results does not support the conclusions. Moreover in the "Results" chapter the description of the results in all tables should be presented in more details. The last problem is that the Authors did not included in revised version 1 the future perspective for the study suggested by one of reviewers and any of valuable remarks suggested by the second reviewer.
