

**Editor's Comment:**

To be accepted, the ms must be corrected.

The information about the reference compounds (Methyl gallate, Gallic acid, Catechin, Chloramphenicol) used is missing in material and methods. The antibacterial activity of catechins varies depending on the structure, including stereoisomers.

The conclusions are not fully supported by the results and must be re-written.

Which results support the conclusion that “the compounds isolated could serve as leads in the search for new and potent antibacterial compounds”? The authors did not isolate nor identified new compounds, and the antimicrobial activity of identified compounds was previously known.
