

Editor's Comment:

I have read manuscript, associated comments and responses carefully. The present work identify the bacteriological flora in local vegetables using traditional microbiological methods. The used methods has several serious disadvantages. For instants, this method cannot identify the non-culturable bacteria which actually constitute 99% of total micro-flora. Here, authors used only two media, Nutrient and MacConkey media, which is also not enough to grow all cultural micorbs. In the era of next generation DNA sequencing, where 16S rRNA gene based bacterial identification is also considered as outdated method, I do not think the present manuscript is beneficial to the scientific community and society in any ways. Moreover, the English language of manuscript is not up to the mark; lost of grammatical errors are there, some sentences are too bulky to follow. Furthermore, I failed to found any novelty in present manuscript.

With these comments, I do not recommend this manuscript for publication.
