

**Factors of Performance of Secondary Schools in Science, Mathematics and English**

**Abstract**

This sequential exploratory mixed methods research aimed to describe which among the demographics: school profile, teacher factor, student factor, learning resources and classroom management, management and governance, family background and parental involvement significantly influenced and predicted the performance of the secondary schools in Science, Mathematics and English in Davao del Sur Division and thereafter to develop empirical models. The instrument used was developed through the responses of the K11 informants, concepts of Creswell, and factor analyses. Using complete enumeration, the researcher selected 68 teachers and principals as respondents. Findings revealed that educational attainment, school based management, field of specialization significantly predicted competition; school type, teachers' attitude and motivation, class size were linked with NAT results in Science; school type, length of service, teachers' attitude and motivation, principal's projects and programs, and school size were associated with NAT results in Mathematics; school type, teachers' attitude and motivation, and classroom management positively correlated with NAT results in English; and school type, teacher's attitude and motivation, family background and parental involvement, and length of service significantly linked with NAT results in Science, Mathematics and English. The empirical models adopted were: (1)  $Y_{\text{Competition}} = -5.028 + 2.472 * \text{Educational Attainment} + 1.514 * \text{School Based Management} - 1.531 * \text{Field of Specialization}$ , (2)  $Y_{\text{NATScience}} = 7.814 - 32.872 * \text{School Type} + 13.007 * \text{Teacher's Attitude and Motivation} + 14.318 * \text{Class Size}$ , (3)  $Y_{\text{NATMathematics}} = 74.026 - 28.828 * \text{School Type} + 5.381 * \text{Length of Service} + 9.523 * \text{Teacher's Attitude and Motivation} - 6.782 * \text{Principal's Projects and Programs} - 4.935 * \text{School Size}$ , (4)  $Y_{\text{NATEnglish}} = 52.674 - 18.505 * \text{School Type} + 11.362 * \text{Teacher's Attitude and Motivation} - 6.518 * \text{Classroom Management}$ , and (5)  $Y_{\text{NATAverage}} = 60.645 - 26.052 * \text{School Type} + 8.362 * \text{Teacher's Attitude and Motivation} - 4.902 * \text{Family Background and Parental Involvement} + 4.158 * \text{Length of Service}$ .

KEYWORDS: Factors performance, Secondary Schools, Science, Mathematics, English

**INTRODUCTION**

One of the goals of Education for All was to improve the quality of education. It was set with a global challenge to transform the lives of millions of children, youth and adults around the world (Education International, 2008). Education for All was to bring benefit of education to "every citizen in every society," wherein national governments, civil society groups, and development agencies like UNESCO and the World Bank are part of the commitment. These goals also contribute to the global pursuit of the eight Millennium Development Goals (MDGs), especially on the universal primary education (United Nations, 2015) which may lead to MDG 1 on eradication of extreme poverty and hunger.

In 2000, the Philippines, as a reaffirmation of the vision set in the 1990 World Declaration, committed itself to the six EFA 2015 Goals at the World Education Forum in Dakar. One of its goals (Goal 6) is to

47 improve every aspect of the quality of education, and ensure their excellence so that recognized and  
48 measurable learning outcomes are achieved by all, especially in literacy, numeracy and essential life  
49 skills. This is congruent to the 1987 Philippine Constitution which likewise guarantees the right to  
50 education of every Filipino. It provided that, "The State shall protect and promote the right of all citizens  
51 to quality education at all levels and shall take appropriate steps to make education accessible to all."  
52 (Philippine Education for All, 2015)

53  
54 One indicator that a country has increased its quality of education is the increase of student and teacher  
55 performances in school. School performance reflects 'the effectiveness and efficiency of the schooling  
56 process.' Effectiveness, in a general sense, refers to the accomplishment of the school's objectives, while  
57 efficiency indicates whether these objectives are accomplished in a timely and costly manner. As these  
58 definitions show, effectiveness and efficiency are judged according to the school's 'objectives'. Although  
59 these are school specific to some degree, school performance research focuses solely on objectives that  
60 schools, or a distinct type of schools, have in common. Despite this specific focus, a number of  
61 foundational studies have indicated that in several aspects measuring performance is multidimensional  
62 (Maslowski, 2001). However, two important indicators of school performance that this study focuses  
63 are: academic achievement of students and excellence in Science, Math and English competitions.

64  
65 United Nations Educational, Scientific and Cultural Organization [UNESCO] (2005) identifies another  
66 indicator of quality of education being provided is the cognitive achievement of learners. According to  
67 Adediwura and Tayo (2007), academic achievement is designated by test and examination scores or  
68 marks assigned by the subject teachers. It could also be said to be any expression used to represent  
69 students' scholastic standing. Lewin, Wasanga and Somerset (2011) report that the academic  
70 achievement of students at secondary school level is not only a pointer of the effectiveness of schools  
71 but also a major determinant of the well-being of youths in particular and the nation in general. Yusuf  
72 and Adigun (2010) and Lydiah and Nasongo (2009) note that the performance of students in any  
73 academic task has always been of special interest to the government, educators, parents and society at  
74 large.

75  
76 Poor performance of students in the National Achievement Test (NAT) remains a serious concern of  
77 teachers, curriculum developers, parents and the general public. NAT has always been the key priority  
78 agenda of DepEd division, regional and central offices in the Philippines. The result of the test is  
79 disclosed yearly for discussion in formulating mechanism for the improvement of this academic  
80 achievement for the years to come. Aside from these, it measures the students' competencies in five  
81 learning areas (i.e. Science, Mathematics, English, Filipino and Araling Panlipunan) administered to  
82 determine the quality of education obtained by the students. Besides, it is also one of the indicators  
83 used in the computation of the DepEd's performance-based bonus (DepEd Order 3, s. 2015). It indicates  
84 that when students in a particular school attain high results in the NAT, there is a greater probability  
85 that the teachers of the same school will receive greater amount of the performance-based bonus.

86  
87 Available data show evidence that the 4<sup>th</sup> year Filipino students have difficulty in the major subjects (i.e.  
88 Science, Mathematics, and English). The national performance of high school students in the NAT, which  
89 was presented in tabular and graphical forms in Philippine Basic Education (2013), showed that on the  
90 average, the fourth year students obtained a Mean Percentage Score (MPS) of 48.90 in the 2012 NAT, an  
91 improved performance when compared with the previous years (44.33 in 2006 and 46.80 in 2005).  
92 However, among the five learning areas, Science was the lowest with an MPS of 40.53 in 2012 NAT,  
93 followed by Mathematics with an MPS of 46.37. It was sad to note that marks obtained by Filipino

94 learners in any of the learning areas, including critical thinking skill were far less than the passing mark  
95 of 75%.

96  
97 On one hand, Digos City National High School, one of the largest schools in Region XI, obtained an  
98 overall mean rating of 59.90%, still not a passing mark, for School Year 2013-2014. For School Year 2014-  
99 2015, on the other hand, Davao del Sur Division obtained an overall MPS of 54.87 for public schools only  
100 and 53.59 for public schools with private schools. The twin goals of Mathematics curriculum in K to 12  
101 are developing every learner the critical thinking and problem solving skills. The MPS obtained by  
102 students in critical thinking is 48.26 for public schools only while 48.17 for with private schools.

103  
104 Studying various factors affecting school performance has been an interesting and challenging topic of  
105 the local, national and international researchers. Some of these are teacher, school, and student factors,  
106 teaching strategies of teachers and strategy and mechanism of the principal.

107  
108 Over a period of time, it has been observed that students exposed to the same lessons by the same  
109 teachers perform differently when they are evaluated (Adesehinwa, 2013). This shows that outside the  
110 school environment, other factors influence students' academic performance. Also differences in the  
111 academic performances of gifted and non-gifted children cannot be traced to school environment  
112 (Adesehinwa & Aremu, 2010). Hence, many other uncontrolled variables can be responsible for  
113 academic performance of students generally, secondary school students inclusive. It was in this ground  
114 that this study was conducted.

115  
116 **Purpose of the Study**

117 The general objective of this study was to seek factors of performance of secondary public and private  
118 schools. Specifically, it aimed to:

- 119 1. Explore factors that are associated with the performance of secondary schools in Science,  
120 Mathematics and English;
- 121 2. Describe the demographics, school profile, teacher factor, student factor, learning resources and  
122 classroom management, management and governance, family background and parental  
123 involvement, and performance of secondary schools in Science, Mathematics and English;
- 124 3. Describe which of the demographics, school profile, teacher factor, student factor, learning  
125 resources and classroom management, management and governance, and family background and  
126 parental involvement are significantly related to the performance of secondary schools in Science,  
127 Mathematics and English;
- 128 4. Determine factors that significantly predict performance of secondary schools in Science,  
129 Mathematics and English from demographics, school profile, teacher factor, student factor, learning  
130 resources and classroom management, management and governance, and family background and  
131 parental involvement; and
- 132 5. Develop empirical models illustrating functions of performance of secondary schools in Science,  
133 Mathematics and English.

134  
135 **Hypotheses**

136  $H_{01}$ : There is no significant relationship between demographics, school profile, teacher factor, student  
137 factor, learning resources and classroom management, management and governance, family  
138 background and parental involvement and school performance in Science, Mathematics and English.

139  
140  $H_{02}$ : No factor significantly predicts the performance of secondary schools in Science, Mathematics and  
141 English.

**Significance of the Study**

Findings of this research are believed to have a significant value to the following:

**Department of Education (DepEd) Schools Division Superintendent and Other Officials.** This study provides information or data which may be used in preparing the set of decisions for actions in the future, directed at achieving goals by preferable means, and in the planning among them to providing trainings in the division, regional and national levels suitable to the needs of the teachers which may be the identified factors significantly influencing the performance of secondary schools in Science, Mathematics and English.

**School Heads and Department Heads.** Results of the study may serve as a guide to the principals (and department heads for large high schools) in planning, programming, and budgeting system (PPBS) among schools before the school year starts. Trainings related to teaching strategies of teachers, strategies of school head, and other factors that greatly influence school performance may be given attention and a priority to educational planners like them.

**Guidance Counselors.** Provided with facts from this study, guidance counselors may use them as bases in planning guidance programs and in counseling students.

**Science, Math, and English Teachers.** The results derived from this study would serve as a guide to Science, Math, and English teachers to employ the teaching strategies that gear towards better performance in Science, Mathematics and English and excellence in competitions.

**Parents.** Results of the study would encourage parents to support their children, teachers, and the school to any endeavor that the school initiates to improve performance of the school in the NAT and in the competitions where their children are inclined to.

**Students.** Results derived would encourage students to attend symposia intended for them and with their parents initiated by the school head and other stakeholders.

**Research Community.** This study would contribute to the existing literature on factors influencing and predicting performance of secondary schools in Science, Mathematics and English.

**Conceptual Framework**

The researcher used the following representation of a conceptual model. Two (2) variables are illustrated in this framework, namely: the independent variables and the dependent variable. The independent variables are teacher’s demographics, school profile, student factor, teacher factor, learning resources and classroom management, management and governance, and family background and parental involvement while the dependent variable is the performance of secondary schools in Science, Mathematics and English which is measured in terms of competitions, NAT rating in Science, NAT Rating in Mathematics, NAT rating in English and average NAT rating in Science, Mathematics and English.

190 **Theoretical Framework**

191 The theories anchored to this study are twofold. First is what Green (2000), Snyder, Acker-Hocevar, and  
192 Snyder (2000), and Huitt, Huitt, Monetti, and Hummel (2009) have suggested in their research-based  
193 school improvement efforts. It stated that there is a need to understand classrooms, schools, families,  
194 and communities as systems. Attention must be paid to both developing well-functioning teams within  
195 schools (i. e., transformational leadership; Chin, 2007). Efforts at school reform that do not consider  
196 schools and classrooms as systems may find that the system merely adapts to the intrusion by outside  
197 forces in order to preserve the integrity of the teachers, classrooms, or schools that are the focus of  
198 change (Gustello & Liebovitch, 2009). Second is the direct offspring or subset of Sigmund Freud’s theory  
199 which is Martin Ford’s motivational systems theory (MST). This framework focuses on the individual as  
200 the unit of analysis, but embeds the individual in the biological, social, and environmental contexts that  
201 are crucial to development. MST attempts to describe the development of the whole person-in-context,  
202 in much the same way a biologist might describe an individual plant and its relation to its immediate  
203 ecological niche, as well as the larger ecosystems in which it resides (Campbell, 2007). Ford proposed a  
204 simple mathematical formula that attempts to represent all these factors in one model. The formula for  
205 effective person-in-context functioning is:  
206

$$\text{Performance/Achievement} = \frac{(\text{Motivation} \times \text{Skill})}{\text{Biological Structure}} \times \text{Responsive Environment}$$

207  
208  
209 The formula proposes that actual “achievement and competence are the results of a motivated, skillful,  
210 and biologically capable person interacting with a responsive environment” (Ford, 1992, p.70). The  
211 motivational systems theory does not attempt to replace or supersede any of the existing theories.  
212 Instead, it attempts to organize the various motivational constructs from different theories into one  
213 model. The main constructs are self-efficacy beliefs, the role of expectancy, and goal orientation. The  
214 formula suggests that in any behavior episode, there are four major prerequisites for effective  
215 functioning: 1) the person must have the *motivation* needed to initiate and maintain the activity until  
216 the goal directing the episode is attained; 2) the person must have the *skill* necessary to construct and  
217 execute a pattern of activity that will produce the desired result; the person’s *biological structure* and  
218 functioning must be able to support the operation of the motivation and skill components; and the  
219 person must have the cooperation of a *responsive environment* that will facilitate progress towards the  
220 goal (Ford, 1992).

221  
222 Campbell’s (2007) study aimed to investigate the relationships between motivational strategies,  
223 biological factors, responsive environment factors, skill/prior ability, and academic performance of these  
224 college students and the impact on the level of academic performance by the college students’ gender  
225 and race. The results of his study indicated that the motivational systems theory is a valid predictor of  
226 performance.

227  
228 **Scope and Delimitation**

229 This exploratory study was limited to the secondary public and private schools in Davao del Sur Division.  
230 It explored the direct experiences of the teachers and principals in Davao del Sur in the determination of  
231 factors of performance of secondary schools in Science, Mathematics and English. In addition, results of  
232 the qualitative data were used in the formulation of the questionnaire. The questionnaire was used to  
233 describe the teacher’s demographics, school profile, teacher factor, student factor, learning resources  
234 and classroom management, management and governance, family background and parental  
235 involvement, and performance of secondary schools in Science, Mathematics and English. Furthermore,

236 the study described which of the demographics, school profile, teacher factor, student factor, learning  
237 resources and classroom management, management and governance, and family background and  
238 parental involvement significantly affected and predicted the performance of secondary schools in  
239 Science, Mathematics and English. Finally, it develops empirical models illustrating functions of  
240 performance of secondary schools in Science, Mathematics and English.

241

242

## 243 **METHOD**

244

### 245 **Research Design**

246 The Sequential Exploratory Mixed Methods Design was used which consisted of two distinct phases:  
247 qualitative followed by quantitative. **Borrego, Douglas, and Amelink (2009), Creswell and Plano Clark**  
248 **(2007)** elucidated that exploratory designs begin with a primary qualitative phase, and then the findings  
249 are validated or otherwise informed by quantitative results. This approach is usually employed to  
250 explore a phenomenon (Creswell, Plano Clark, et al., 2003) and to develop a standardized instrument in  
251 a relatively unstudied area (Creswell and Plano Clark, op. cit.). The qualitative phase identifies important  
252 variables to study quantitatively when the variables are unknown (Creswell, 2007; Creswell, et al., 2003).  
253 In this study, the researcher developed an instrument of factors of performance of secondary schools in  
254 Science, Mathematics and English as an intermediate step between the phase that was built on  
255 qualitative results and was used in the subsequent quantitative data collection.

256

### 257 **Locale of the Study**

258 Department of Education (DepEd) in Davao region has 10 divisions. One of which is the Davao del Sur  
259 division in the province of Davao del Sur. Formerly it has 23 districts but through RA 10360 An Act  
260 Creating the Province of Davao Occidental known as the Charter of the Province of Davao Occidental  
261 approved January 14, 2013 Davao Occidental is created and therefore establish, maintain a separate  
262 school division in the province whose jurisdiction shall cover all the municipalities of the new province  
263 as stated in RA 10360 sec 44a with nine districts in five municipalities, leaving Davao del Sur division  
264 with 14 districts.

265

### 266 **Informants Selection and Sampling Procedure**

267 In qualitative phase, purposive sampling was used to determine the key informant interview samples  
268 consisting of 20 informants composed of teachers and principals. Five from performing public schools,  
269 five from performing private schools, five from non-performing public schools, and five from non-  
270 performing private schools. The topmost performing public and private schools and bottommost public  
271 and private schools were identified based on their average ratings in Science, Mathematics and English  
272 in the NAT for the School Year 2014-2015. The informants were from from Hagonoy National High  
273 School, Sinawilan National High School, St. Therese School of Bansalan, and Holy Cross of Sulop, Inc.

274

275 In the quantitative phase, the respondents of this study were secondary school principals and  
276 Mathematics, Science, and English teachers regardless of year/grade level. For teacher-respondents, the  
277 researcher used complete enumeration with a grand total 68 teachers and principals.

278

### 279 **Research Instruments**

280 An interview guide and a survey questionnaire were used as instruments in this study. The former was  
281 used for the qualitative phase and the latter was utilized for the quantitative phase. A set of guide  
282 questions was made up of open-ended questions to explore the factors that were associated with the

283 performance of secondary schools in Science, Mathematics, and English. It included two (2) grand tour  
284 questions with probing questions in each. On the other hand, the survey questionnaire contained four  
285 (4) parts, namely: Part I – Teacher’s Demographics, Part II – School Profile, Part III – Survey  
286 Questionnaire on Factors of Performance of Secondary Schools in Science, Mathematics and English  
287 (SQFPSSME) which covered the five (5) emerging themes with their respective clustered themes, and  
288 Part IV – School Performance.

289

### 290 **Data Collection Procedures**

291 Qualitative Phase. Data collection in the qualitative phase used the following 4-step procedure. First,  
292 was formulation of guide questions. A set of guide questions was made up of open-ended questions to  
293 explore the factors that are associated with the performance of secondary schools in Science,  
294 Mathematics, and English. It contained two grand tour questions with probing questions in each.  
295 Second, was the validation of the Key Informant Interview (KII) guide questions. The set of guide  
296 questions was validated and enhanced by three experts. Third, was the pilot testing of KII. The guide  
297 questions were tried out to three secondary school teachers who were not part of the group of KII  
298 informants. Lastly, was the conduct of KII. The interviews were personally conducted by the researcher  
299 to four schools consisting 21 teachers and principals all in all as informants.

300

301 Quantitative Phase. Data collection in the quantitative phase used the following 5-step procedure:

302 Step 1: Creswell Analysis. The responses of informants during the KII were transcribed. The transcripts  
303 were read several times. The significant statements were crafted from the transcripts. Each significant  
304 statement was temporarily assigned to a cluster theme and subsequently to an emerging theme. All  
305 significant statements with the same cluster and emerging themes were collated and were analyzed  
306 through Creswell Analysis. Consequently, items were formulated using the organized significant  
307 statements. Through this analysis, 128 item-survey questionnaire which was subjected to factor analysis  
308 pertaining to the factors that are associated with the performance of secondary schools in Science,  
309 Mathematics and English were articulated. A 5-point Likert-type scale was used for each statement,  
310 namely: (5) very high, (4) high, (3) moderate, (2) low, and (1) very low. Step 2: Validation of the 128-  
311 Item Survey Questionnaire. The items formulated were subjected for content validation by three (3)  
312 experts in this field of focus. Step 3: Reliability Testing. These items were conducted to 20 respondents  
313 of the same school, that is, Matan-ao National High School, Poblacion, Matan-ao, Davao del Sur. The  
314 researcher used internal consistency reliability testing, where Cronbach’s alpha was computed. The  
315 responses were tallied, analyzed and interpreted for reliability testing using SPSS version 17.0. The  
316 computed value of Cronbach’s alpha was .910 which was described as excellent by George’s and  
317 Mallery’s (2003) rule of thumb. Step 4: Factor Analysis. The same set of items which was conducted to  
318 150 respondents was subjected to Factor analysis. This analysis validates the grouping of the identified  
319 temporary cluster and emerging themes in the Creswell analysis. With this analysis, it was found that  
320 there were five emerging themes that came out. These are student factors, teacher factors, learning  
321 resources and classroom management, management and governance, and family background and  
322 parental involvement. Additionally, out of 128 statements, only 105 were left which were grouped  
323 accordingly by emerging and cluster themes. Step 5: Development of Research Instrument. The  
324 instrument was developed by the researcher. It contained four parts, namely: Part I – Teacher’s  
325 Demographics, Part II – School Profile, Part III – Survey Questionnaire on Factors of Performance of  
326 Secondary Schools in Science, Mathematics and English (SQFPSSME) which covered the five (5)  
327 emerging themes, and Part IV – School Performance. This research instrument was given to 68 main  
328 respondents to answer the research problems as stated in the purpose of the study.

329

330

331 **RESULTS AND DISCUSSION**

332

333 **Factors that Influence the Performance of Secondary Schools in Science, Mathematics and English**

334 As the informants were interviewed about the factors of performance of secondary schools in Science,  
335 Mathematics and English, there were two factors that surfaced, namely: teacher's demographics and  
336 school profile, and five themes emerged, namely: teacher factor, student factor; learning resources and  
337 classroom management, management and governance, family background and parental involvement.  
338 Seven indicators were identified under the first factor, namely: sex, civil status, employment status,  
339 length of service, educational attainment, vertical alignment and teaching in the field of specialization;  
340 and three indicators under the second factor, namely: school size, class size and school type. On the  
341 other hand, the five emerging themes had clustered themes in each. In the first emerging theme, four  
342 clustered themes were determined, namely: teacher's expertise, teacher's attitude and motivation,  
343 teacher's trainings and advancement and teacher's teaching strategies and methodology. In the second  
344 theme, two clustered themes were identified, namely: student's behavior and student's performance.  
345 Another two were determined under the third emerging theme, namely: learning resources  
346 management and classroom management. For the fourth emerging theme, another three clustered  
347 themes were identified, namely: principal's relationship to stakeholders, principal's projects and  
348 programs, and school based management. While for the fifth and last emerging theme, two themes  
349 were conceptualized, namely: family background and parental involvement. Results in the qualitative  
350 and quantitative aspects are discussed in the succeeding paragraphs.

351

352 **Teacher Demographics**

353 **Civil Status.** Students' success is greatly influenced by teachers' factors as to teaching. One of the  
354 numbers of factors that has been found to be related to student's success is the teacher's civil status.  
355 Teacher's status affects the student's productivity and performance in school

356

357 **Employment Status.** Teachers with high quality performance are more likely to have a stable job.  
358 Teacher's performance is the basis for determining whether the teacher has done his/her part as a  
359 teacher inside the classroom. Hence, if the teachers are not yet stable their performance is greatly  
360 affected.

361

362 **Length of Service.** Teachers, who are experiencing a high quality of work life, are motivated to perform  
363 at higher levels and are willing to stay with an organization. If teachers find satisfaction, teacher work  
364 life would lead to greater stability. These factors influence teacher's performance and play a major role  
365 in their decisions to switch schools or leave the teaching profession.

366

367 **Education.** Student's academic achievement also depends on the teacher's experience and educational  
368 qualifications. Teachers acquiring higher education allow themselves to grow and make sound of  
369 educational improvements that address the achievement existing gaps. In order for a student to get  
370 where they are now to where they need to be educationally, teachers with good qualifications should  
371 always be present to ensure student learning outcomes.

372

373 **Vertical Alignment.** Teaching and learning process would be worthwhile if teachers are passionate with  
374 their work. Practicing one's acquired profession enables him/her to carry out the given tasks. With such,  
375 teachers will not find difficulty to handle the class for they are trained and honed to perform what they  
376 are expected to do. However, in some cases, there are problems in terms of vertical alignment.

377

378 **Field of Specialization.** As to field of specialization, transfer of knowledge is easy if teachers already  
379 mastered their subject matter. With this, teachers are likely to use various teaching strategies and  
380 techniques suitable to the level of learners. They can think of better activities that would motivate the  
381 students to learn and develop their critical thinking. Through this, teachers are expected to provide a  
382 work effort far beyond normal expectations to cater the individual needs of diverse students.

383

#### 384 **School Profile**

385 **Class Size.** Another factor that affects the school's performance is the school size. There is a difference  
386 in handling the school in terms of the school size. The bigger the school the greater the responsibility of  
387 the administrator assigned in the said school. On the other hand, if the school is small then the  
388 administrator can manage well the school. In order to make sure learning and comprehension, class size  
389 should be looked into to cater individual's needs and give sufficient attention for their wants.

390

391 **School Type.** There are two types of school – the public school and the private school. The school type is  
392 a factor in the school performance as to the teachers' and students' part.

393

#### 394 **Teacher Factor**

395 The result of the quantitative research shows that there is a higher Level of agreement of teachers and  
396 principals on teacher factors that are perceived to be associated with the performance of secondary  
397 schools in Science, Mathematics and English. It only means that teacher factor can affect the  
398 performance of the secondary schools.

399

400 **Teacher's Expertise.** When it comes to the teacher's expertise, it is proven in the study that it is also a  
401 factor that affects the performance of the school. Thus, the expertise of teacher should be considered as  
402 one of the teacher factors in terms of school performance in the three disciplines.

403

404 **Teacher's Attitude and Motivation.** The attitude and motivation of the teachers also matter in the  
405 teaching-learning process because these two will affect the performance of the teachers in terms of  
406 their teaching. If the teacher has a positive attitude towards the learning and welfare of the students  
407 and the teacher also is well motivated then it reflects on how the students perform in the class. In  
408 terms of the school's academic performance, teacher's attitude and motivation must be taken into  
409 account. These two affects many of the issues surrounding the quality of teacher's work for the way  
410 they perceive and handle the students' diversity matters a lot.

411

412 **Teacher's Trainings and Advancement.** In order for teachers to grow and cope with the latest trends  
413 with regards to handling and catering student's hunger to be educated, they should first let themselves  
414 to be fully equipped with it through participating trainings and advancement seminars.

415 **Teacher's Teaching Strategies and Methodology.** Students learn best from the teacher they like. There  
416 are certain subjects wherein the students find difficulty in learning. The teacher should be well-equipped  
417 with teaching strategies and methodologies so that the students will not find the subject too dull and  
418 boring. The teacher should find remedy of the certain dilemma, so that the students will be motivated  
419 and will learn to love the subject no matter how difficult it is. Thus if there are problems that has been  
420 encountered, there should always be quick solutions especially when the knowledge of the student is at  
421 stake. On the other hand, the study also looks into the general perspective or the teaching approach of  
422 the teachers toward the disciplines. It has a great impact in terms of performance of students. It was  
423 well-observed in the teacher's responses. And so it is proved that teaching approach used by the  
424 teachers inside the classroom setting greatly affects students' performance.

425

426 **Student Factor**

427 Students are the primary elements of learning. Teaching and learning would not be possible without  
428 them for they are the focus of it.

429

430 **Students' Behavior.** Another factor that affects the performance of the students in school is the  
431 students' behavior. Thus, students' behavior should be taken into account as to assessing student's  
432 performance in school.

433

434 **Student's Performance.** As to factors influencing school's performance, there are so many aspects to  
435 look into. Students are the primary element in the teaching and learning process. Their success and  
436 development can be measured by their performance in any aspect in the process.

437

438 **Learning Resources and Classroom Management**

439 The learning resources and management are considered as factors in the performance of the students  
440 because the former serves as one of the sources of knowledge and the latter is the one that helps in  
441 conveying the knowledge to the students.

442

443 **Learning Resources Management.** Learning resources is found to be one of the factors that affect the  
444 performance of the school. The students learn better if they have it firsthand. If the school has complete  
445 learning resources then the students also will have quality performance. Moreover, most students are  
446 visual learners. Hence, they learn best when they can see the actual thing that the teacher is trying to  
447 convey. To ensure better understanding and learning, it is essential that the facilities and equipment are  
448 provided.

449

450 **Classroom Management.** The importance of classroom management is that learning will only take effect  
451 if the teacher has the capacity and the ability to handle the class well. It means that the teacher is the  
452 driving force when it comes to imparting the knowledge to the students. If the teacher has low  
453 classroom management, then there is a tendency that the class will not learn from the teacher.

454

455 **Management and Governance**

456 The management and governance should also be looked upon because it is important to see how the  
457 higher authorities handle the school. The success of the school highly depends on how the  
458 administration manages the certain institution. As the quantitative result showed that there is an  
459 average level of agreement of teachers and principals on school based management that is perceived to  
460 be associated with the performance of secondary schools in Science, Mathematics and English.

461

462 **Principal's Relationship to and Among Stakeholders.** Stakeholders are the people or organizations who  
463 have a great importance or influence in an educational institution. It is essential that schools must take  
464 into consideration the stakeholders in order to get support from them. Therefore, schools need the help  
465 or support from the stakeholders for them to be productive. Building a harmonious relationship among  
466 stakeholders is very crucial since stakeholders are the receiver of the product of the schools. Hence, it is  
467 good to take good care of the relationship that is already built. There should be equal effort between  
468 the school and the stakeholders in order to maintain a lasting relationship.

469

470 **Principal's Projects and Programs.** Teachers need not to be efficient but effective as well so it is  
471 necessary for them to initiate projects/programs for students' benefits. Hence, teachers should also give  
472 importance to the project/program that would give the students opportunity to gain education that  
473 they ought to gain.

474

475 **School Based Management.** The school principals have different ways in dealing with their teachers as  
476 well as the way they handle their school. Thus, the strategies of the principal may vary but it is still for  
477 the betterment of the performance of the school. Students do not only learn from school but also in  
478 their home and community. Community as one of the students' learning environment, it must also be  
479 healthy for it helps molding the students not just as a better person but in totality. Monitoring is one  
480 way of looking into the smooth flow of the learning process, and it is observed in the responses of the  
481 key informants. Thus, it is very essential to urge the teachers to be particular with their preparation in  
482 teaching as to see the readiness and preparedness to cater the students' needs.

483

#### 484 **Family Background and Parental Involvement**

485 The next emerging theme was the parent factor. The quantitative results stated that there was an  
486 average level of agreement of teachers and principal on family background and parental involvement  
487 that are perceived to be associated with the performance of secondary schools in Science, Mathematics  
488 and English.

489

490 **Family Background.** The learner's family background should be properly checked so that the teachers  
491 may be able to understand the student's performance. The financial status of the parents as part of the  
492 family background must be monitored so that their children would not be at risk of being one of the  
493 out of school youth as well as it would not be the hindrance with the learner's performance. For these  
494 reasons, it is better to have a portfolio of students regarding their family background.

495

496 **Parent Involvement.** Parents' involvement is also a big factor in students' performance for the students  
497 look up into them for support. Therefore, parents need to play their part as to give their students  
498 proper education and guidance for them not to be tempted and focus on their studies. Moreover,  
499 students' inspiration to go to school varies if they can feel the care and love of their parents. Therefore,  
500 parents' attention is the utmost need of the students to pursue their studies for parents' support is still  
501 the best way to show their care and love.

502

#### 503 **Teacher's Demographics, School Profile, Teacher Factor, Student Factor, Learning Resources and** 504 **Classroom Management, Management and Governance, Family Background and Parental** 505 **Involvement, and Performance of Secondary Schools in Science, Mathematics and English**

506

507 **Teacher's Demographics.** The demographic profile of respondents includes gender, civil status,  
508 employment status, educational attainment, vertical alignment and field of specialization. It depicted  
509 that out of 68 respondents, 23 or 33.8% of the respondents are male and 45 or 66.2% are female; 27 or  
510 39.7% of the respondents were single, 39 or 57.4% were married, and the other 2 or 3% were widow/er  
511 and separated; 54 or 79.4% were permanent, 10 or 14.7% were contractual, 4 or 5.9% were substitute  
512 and others; 40 or 58.8% of the respondents belong to 0 to 5 years, 13 or 19.1% belong to 6 to 10 years,  
513 and 15 or 22.1% belong to 11 years and above. Regarding their education, 43 or 63.2% were bachelor's  
514 degree holders only, 23 or 33.8% were master's degree holders and 2 or 2.9% were doctoral degree  
515 holders. Of those who acquired master's or doctoral degree, only 15 or 22.1% were vertically aligned  
516 while 10 or 14.7% were not. Out of 68 respondents, 48 or 70.6% were teaching in their field of  
517 specialization while 20 or 29.4% were not.

518

519 **School Profile.** The school profile of the selected secondary schools included school size, average class  
520 size and school type. Of the respondents, only 4 or 5.9% belonged to large school with a student  
521 population of 1000 and above, 26 or 38.2% belonged to medium size schools while 38 or 55.9%

522 belonged to small schools. Fifty-two, or 76.5%, respondents belong small class size with a range of 26 to  
523 50 and 16 or 23.5% belonged to large class size with more than 50 students. Fifty-three, or 77.9%, of the  
524 respondents came from public while 15 or 22.1% belonged to private.

525  
526 **Teacher Factor.** Teacher factors included teacher's expertise, teacher's attitude and motivation,  
527 teacher's trainings and advancement, and teacher's teaching strategies and methodology. It showed  
528 that the mean of teacher's expertise is 4.22; teacher's attitude and motivation, 4.37; teacher's trainings  
529 and advancement, 4.39; and teacher's teaching strategies and methodology, 4.17. All of these teacher  
530 factors had a descriptive equivalent of *agree*, which means that the statements under these factors  
531 were *often true* for the respondents. Similarly, teacher factor as a whole obtained a mean of 4.29, with a  
532 descriptive equivalent of *agree*. This means further that the statements are *often true* for the  
533 respondents.

534  
535 **Teacher's Expertise.** Ten statements are found under teacher's expertise. It showed that the means of  
536 all statements under this cluster theme obtained a mean rating ranging from 3.50 to 4.49, which  
537 descriptive equivalent was *agree*. This means that the statements are *often true* for the respondents on  
538 the average.

539  
540 **Teacher's Attitude and Motivation.** Fifteen statements are under teacher's attitude and motivation. It  
541 revealed that among the 15 statements, only three statements had a mean greater than 4.50, which  
542 were equivalent to *strongly agree*. This means that these statements, "Teachers are enthusiastic in the  
543 delivery of the daily lessons," "Teachers are willing to be trained for their professional development,"  
544 and "Teachers feel fulfilled when their former students perform well in school" are *always or almost*  
545 *always true* for the respondents. On the other hand, other statements obtained means whose  
546 descriptive equivalents were *agree*. This means that these statements are *often true* for the  
547 respondents. Teacher's attitude and motivation in general obtained a mean of 4.37 or *agree*. It means  
548 that on the average, the statements are *often true* for the respondents.

549  
550 **Teacher's Trainings and Advancement.** Three statements were under teacher's trainings and  
551 advancement. It showed that among the statements, the statement "Teachers feel that attending  
552 content-based and K to 12 trainings is a necessity" obtained a mean of 4.57 which was equivalent to  
553 *strongly agree*. This means that that statement is *always or almost always true* for the respondents. On  
554 the other hand, statements 2 and 3 obtained a mean of 4.12 and 4.49, respectively which were both  
555 equivalent to *agree*. It means that the statements are *often true* for the respondents. Teacher's trainings  
556 and advancement as a whole obtained a mean of 4.39 or *agree*. It further means that the statements on  
557 the average are *often true* for the respondents.

558  
559 **Teacher's Strategies and Methodology.** Fifteen statements fall under this cluster theme. All statements  
560 had a mean within the range of 3.50 to 4.49, which was equivalent to *agree*. It means further that all  
561 statements are *often true* for the respondents. Furthermore, the teacher's teaching strategies and  
562 methodology had a mean of 4.17, which was equivalent to *agree*. It means that the statements of this  
563 cluster theme are *often true* for the respondents.

564  
565 **Student Factor.** Student factor included student's behavior and student's performance. It showed that  
566 the student's behavior and student's performance obtained a mean of 2.93 and 3.20, respectively. Both  
567 values had a descriptive equivalent of *moderately agree*. It means further that the statements under  
568 these cluster themes are *sometimes true* for the respondents. Similarly, the student factor as a whole

569 obtains a mean of 3.07, which was equivalent to *moderately agree*. It means that the statements under  
570 this emerging theme are *sometimes true* for the respondents.

571

572 **Student's Behavior.** Six statements are classified under student's behavior. It showed that all  
573 statements had mean within the range of 2.50 to 3.49, which were equivalent to *moderately agree*. It  
574 means that all of these statements are *sometimes true* for the respondents on the average. Similarly the  
575 overall mean of student's behavior was 2.93 which was equivalent to *moderately agree*. It means the  
576 statements in general are *sometimes true* for the respondents.

577

578 **Student's Performance.** Ten statements are identified under student's performance. It showed that all  
579 statements had means which were within the range of 2.50 to 3.49. This statistics is equivalent to  
580 *moderately agree*. It showed that the statements were *sometimes true* for the respondents in general.  
581 Similarly, the overall mean of student's performance was 3.20 which was equivalent to *moderately*  
582 *agree*. It means the statements in general are *sometimes true* for the respondents.

583

584 **Learning Resources and Classroom Management.** Learning resources and classroom management is  
585 divided into two cluster themes, namely: learning resources management and classroom management.  
586 These are discussed in the following paragraphs. It showed that learning resources management had a  
587 mean of 3.65 while that of classroom management was 3.99. Both statistics were equivalent to *agree*. It  
588 means that the statements under these cluster themes are *often true* for the respondents.

589

590 **Learning Resources Management.** Seven statements were classified under learning resources  
591 management. It showed that statement 1 got the highest mean of 4.60 or *strongly agree*. It means that  
592 the respondents in general strongly agree to the statement, "The school has convenient chairs in the  
593 classroom." Equivalently, the statement was *always or almost always true* for the respondents.  
594 Statements 2, 4 and 6 obtained mean score of 3.88, 3.70, and 3.94, respectively. All these statements  
595 were equivalent to *agree*. It means that these statements are *often true* for the respondents. The overall  
596 mean of learning resources management was 3.65 or *agree*. It means that on the average the  
597 statements are *often true* for the respondents.

598

599 **Classroom Management.** Five statements are classified under classroom management. Results showed  
600 that all statements had means within the range of 3.50 to 4.49, which were all described as *agree*. It  
601 showed that the statements were all *often true* for the respondents. The overall mean of classroom  
602 management was 3.99, which was equivalent to *agree*. It means that on the average, the statements are  
603 *often true* for the respondents.

604

605 **Management and Governance.** Management and governance included principal's relationship to  
606 stakeholders, principal's projects and programs, and school based management. It revealed that the  
607 principal's relationships to stakeholders and principal's projects and programs had means of 4.13 and  
608 3.86, respectively. These were equivalent to *agree*. It means the statements under these cluster themes  
609 are *often true* for the respondents. On the other hand, school based management got a mean of 3.44,  
610 which was equivalent to *moderately agree*. It means the statements under this cluster theme are  
611 *sometimes true* for the respondents. The overall mean of management and governance was 3.81, which  
612 was equivalent to *agree*. It means that on the average the statements are *often true* for the  
613 respondents.

614

615 **Principal's Relationship to Stakeholders.** Six statements are under the cluster theme principal's  
616 relationship to stakeholders. It depicts that the means of the statements were within the range of 3.50

617 to 4.49. These were described as *agree*. It means that all these statements are *often true* for the  
618 respondents. The overall mean of principal's relationship to stakeholders was 4.14, which was  
619 equivalent to *agree*. It means that on the average the statements are *often true* for the respondents.  
620

621 **Principal's Projects and Programs.** Ten statements belong to principal's projects and programs. It  
622 depicted that the means of the statements were within the range of 3.50 to 4.49. These were described  
623 as *agree*. It means that all these statements are *often true* for the respondents. The overall mean of  
624 principal's projects and programs was 3.86, which is equivalent to *agree*. It means that on the average  
625 the statements are *often true* for the respondents.  
626

627 **School Based Management.** Eight statements were under the cluster theme school based management.  
628 It depicted that statements 1, 2, 4 7 and 8 had means within the range of 3.50 to 4.49. These were  
629 described as *agree*. It means that these statements are *often true* for the respondents. Statements 3 and  
630 6, on the other hand, had means within the range of 2.50 to 3.49. These were described as *moderately*  
631 *agree*. It means that these statements are *sometimes true* for the respondents. Statement 5 obtained a  
632 mean of 2.41, which was equivalent to *disagree*. It means that this statement is *rarely true* for the  
633 respondents. The overall mean of school based management was 3.44, which was equivalent to  
634 *moderately agree*. It means that on the average the statements are *sometimes true* for the respondents.  
635

636 **Family Background and Parental Involvement.** The emerging theme family background and parental  
637 involvement was divided into two cluster themes namely: family background and parental involvement.  
638 It showed that family background had a mean of 3.54, which was described as *agree*. It means that the  
639 statements under this cluster theme are *often true* for the respondents. On the other hand, parental  
640 involvement obtained a mean of 3.35, which was described as *moderately agree*. It means that the  
641 statements under this cluster theme were *sometimes true* for the respondents. The overall mean of  
642 family background and parental involvement was 3.44, which was equivalent to *moderately agree*. It  
643 means that on the average the statements are *sometimes true* for the respondents.  
644

645 **Family Background.** Six statements are under the cluster theme family background. It depicts that  
646 statements 1 to 4 have means within the range of 3.50 to 4.49. These were described as *agree*. It means  
647 that these statements are *often true* for the respondents. Statements 5 and 6, on the other hand, had  
648 means of 3.32 and 3.15, respectively. These were described as *moderately agree*. It means that these  
649 statements are *sometimes true* for the respondents. The overall mean of family background is 3.54,  
650 which was equivalent to *agree*. It means that on the average the statements of this theme are *often true*  
651 for the respondents.

652 **Parental Involvement.** Four statements are under the cluster theme parental involvement. It depicted  
653 that statement 3 had a mean of 3.57 which was described as *agree*. It means that the statement is *often*  
654 *true* for the respondents. Statements 1, 2 and 4, on the other hand, had means within the range of 2.50  
655 to 3.49. These were described as *moderately agree*. It means that these statements are *sometimes true*  
656 for the respondents. The overall mean of parental involvement was 3.35, which is equivalent to  
657 *moderately agree*. It means that on the average the statements of this theme are *sometimes true* for the  
658 respondents.  
659

660 **Performance of Secondary Schools in Science, Mathematics and English.** Performance of secondary  
661 schools in Science, Mathematics and English included the excellence in competitions and the NAT  
662 results. Each of these indicators was discussed in the succeeding paragraphs.  
663

664 **Excellence in Competitions.** The results showed that 6 or 22.2% of Science teachers won in the  
665 competitions while 21 or 77.8% did not; 8 or 44.4% of Mathematics teachers won in the competitions  
666 while 10 or 55.6% did not; 7 or 36.8.% of English teachers won in the competitions while 12 or 63.2% did  
667 not; and 2 or 50% of the principals whose teachers won in the competition while 2 or 50% did not. On  
668 the average, 23 or 33.8% won in the competition while 45 or 66.2% did not.

669  
670 **NAT Results.** It showed that the mean percentage rating of NAT in Science among Science teachers is  
671 56.57% with an average mastery level, in Mathematics among Mathematics teachers is 55.65% with an  
672 average mastery level, in English among English teachers is 53.73% with an average mastery level, and in  
673 average NAT results in Science, Mathematics and English is 55.32% with an average mastery level.

674  
675 **Relationships among Teacher's Demographics, School Profile, Teacher Factor, Student Factor, Learning**  
676 **Resources and Classroom Management, Management and Governance, and Family Background and**  
677 **Parental Involvement on the Performance of Secondary Schools in Science, Mathematics and English**

678  
679 **Teacher's Demographics.** Results revealed that marital status and length of service significantly linked  
680 with NAT results in Science and in Mathematics. Moreover, employment status showed significant  
681 relationship to NAT results in Science. Further, educational attainment and vertical alignment showed  
682 relationship with competitions. However, sex and field of specialization, showed no significant  
683 relationship with the performance of secondary schools in Science, Mathematics and English.

684  
685 **School Profile.** Results showed that school size, class size, and school type **significantly linked** with the  
686 NAT results in Mathematics, in English and the average results.

687  
688 **Teacher Factor.** Results showed that teachers' expertise had **no significant** relationship with the  
689 performance of secondary schools in Science, Mathematics and English. On the other hand, teachers'  
690 attitude and motivation and teacher factor had **a significant** relationship with NAT results in Science, in  
691 Mathematics, in English. Likewise, there is **a significant** relationship between the teacher's trainings and  
692 advancement and NAT results in Science while there is **a significant** relationship between the teachers'  
693 teaching strategies and methodology with the NAT results in English.

694  
695 **Student Factor.** All indicators, students' behavior, students' performance, and student factor showed **no**  
696 significant with the performance of secondary schools in Science, Mathematics and English.

697  
698 **Learning Resources and Classroom Management.** Results showed that there was a significant  
699 relationship between the learning resources management and the competitions. In terms of classroom  
700 management, it showed no significant relationship between the student factor and the performance of  
701 secondary schools in Science, Mathematics and English while learning resources and classroom  
702 management in general, showed a significant relationship with competitions.

#### 703 704 705 **Management and Governance**

706 Results showed that there was a **significant relationship** between the principal's relationship to  
707 stakeholders and the competitions, NAT results in Science, in Mathematics and average results. It also  
708 showed that there is a **significant relationship** between the principal's projects and programs and school  
709 based management with NAT results in English. Likewise, there is a **significant relationship** between the  
710 management and governance and the competitions.

711

712 **Family Background and Parental Involvement**

713 Results revealed that family background and parental involvement had no significant relationship with  
714 the performance of secondary schools in Science, Mathematics and English.

715

716 **Multiple Regression Analysis of the Predictor Variables on the Performance of Schools in Science,**  
717 **Mathematics and English**

718

719 **Competitions.** The probability value of F statistic of 11.683 is .000, which is less than .05 level of  
720 significance. Thus, the null hypothesis is rejected. This signifies that there is a significant relationship  
721 between the set of independent variables (i.e. educational attainment, school based management, and  
722 field of specialization) and the dependent variable (competitions). Moreover, multiple R of .595 means  
723 that there is a moderate correlation or substantial relationship of the predictor variables (i.e.  
724 educational attainment, school based management, and field of specialization) on competitions.  $R^2 =$   
725 .354 or 35.4% of the total variation in the competitions is explained by its linear function of educational  
726 attainment, school based management, and field of specialization. In other words, 64.6% of the entire  
727 variation of competitions is not accounted to the variation of the educational attainment, school based  
728 management, and field of specialization. This suggests that there might be some other factors which  
729 influence the competitions.

730

731 The unstandardized coefficients of educational attainment, school based management, and field of  
732 specialization obtain t-values with Sig. values of .000, .001, and .029. All Sig. values are less than .05 level  
733 of significance. It denotes that the competition is significantly predicted by educational attainment,  
734 school based management, and field of specialization. Furthermore, the empirical model is  $Y_{\text{Competition}} = -$   
735  $5.028 + 2.472 * \text{Educational Attainment} + 1.514 * \text{School Based Management} - 1.531 * \text{Field of}$   
736  $\text{Specialization}.$

737

738 **NAT Rating in Science.** The probability value of F statistic of 29.726 is .000, which is less than .05 level of  
739 significance. Thus, the null hypothesis is rejected. This signifies that there is a significant relationship  
740 between the set of independent variables (i.e. school type, teacher's attitude and motivation, and class  
741 size) and the dependent variable (NAT Rating in Science). Moreover, multiple R of .763 means that  
742 there is a high correlation or marked relationship of the predictor variables (i.e. school type, teacher's  
743 attitude and motivation, and class size) on the NAT Rating in Science.  $R^2 = .582$  or 58.2% of the total  
744 variation in the NAT rating in Science is explained by its linear function of school type, teacher's attitude  
745 and motivation, and class size. In other words, 41.8% of the entire variation of NAT rating in Science is  
746 not accounted to the variation of the school type, teacher's attitude and motivation, and class size. This  
747 suggests that there might be some other factors which influence the NAT rating in Science.

748 The unstandardized coefficient of school type, teacher's attitude and motivation, and class size obtain t-  
749 values with Sig. values of .000, .000, and .002. All Sig. values are less than .05 level of significance. It  
750 denotes that the NAT rating in Science is significantly predicted by school type, teacher's attitude and  
751 motivation, and class size. Furthermore, the empirical model is  $Y_{\text{NATScience}} = 7.814 - 32.872 * \text{School Type} +$   
752  $13.007 * \text{Teacher's Attitude and Motivation} + 14.318 * \text{Class Size}.$

753

754 **NAT Rating In Mathematics.** The probability value of F statistic of 20.288 is .000, which is less than .05  
755 level of significance. Thus, the null hypothesis is rejected. This signifies that there is a significant  
756 relationship between the set of independent variables (i.e. school type, length of service, teacher's  
757 attitude and motivation, principal's projects and programs, and school size) and the dependent variable  
758 (NAT Rating in Mathematics).

759

760 Moreover, multiple R of .788 means that there is a high correlation or marked relationship of the  
761 predictor variables (i.e. school type, length of service, teacher's attitude and motivation, principal's  
762 projects and programs, and school size) on the NAT Rating in Science.  $R^2 = .621$  or 62.1% of the total  
763 variation in the NAT rating in Mathematics is explained by its linear function of school type, length of  
764 service, teacher's attitude and motivation, principal's projects and programs, and school size. In other  
765 words, 37.9% of the entire variation of NAT rating in Mathematics is not accounted to the variation of  
766 the school type, length of service, teacher's attitude and motivation, principal's projects and programs,  
767 and school size. This suggests that there might be some other factors which influence the NAT rating in  
768 Mathematics.

769  
770 The unstandardized coefficient of school type, length of service, teacher's attitude and motivation,  
771 principal's projects and programs, and school size obtain t-values with Sig. values of .000, .006, .002,  
772 .007, and .037, respectively. All Sig. values are less than .05 level of significance. It denotes that the NAT  
773 rating in Science is significantly predicted school type, length of service, teacher's attitude and  
774 motivation, principal's projects and programs, and school size. Furthermore, the empirical model is  
775  $Y_{\text{NATMathematics}} = 74.026 - 28.828 * \text{School Type} + 5.381 * \text{Length of Service} + 9.523 * \text{Teacher's Attitude and}$   
776  $\text{Motivation} - 6.782 * \text{Principal's Projects and Programs} - 4.935 * \text{School Size}.$

777  
778 **NAT Rating in English.** The probability value of F statistic of 21.532 is .000, which is less than .05 level of  
779 significance. Thus, the null hypothesis is rejected. This signifies that there is a significant relationship  
780 between the set of independent variables (i.e. school type, teacher's attitude and motivation, and  
781 classroom management) and the dependent variable (NAT Rating in English).

782  
783 Moreover, multiple R of .709 means that there is a high correlation or marked relationship of the  
784 predictor variables (i.e. school type, teacher's attitude and motivation, and classroom management) on  
785 the NAT Rating in English.  $R^2 = .502$  or 50.2% of the total variation in the NAT rating in English is  
786 explained by its linear function of school type, teacher's attitude and motivation, and classroom  
787 management. In other words, 49.8% of the entire variation of NAT rating in English is not accounted to  
788 the variation of the school type, teacher's attitude and motivation, and classroom management. This  
789 suggests that there might be some other factors which influence the NAT rating in English.

790  
791 The unstandardized coefficient of school type, teacher's attitude and motivation, and classroom  
792 management obtained t-values with Sig. values of .000, .000, and .025, respectively. All Sig. values are  
793 less than .05 level of significance. It denotes that the NAT rating in English is significantly predicted by  
794 school type, teacher's attitude and motivation, and classroom management. Furthermore, the empirical  
795 model is  $Y_{\text{NATEnglish}} = 52.674 - 18.505 * \text{School Type} + 11.362 * \text{Teacher's Attitude and Motivation} -$   
796  $6.518 * \text{Classroom Management}.$

797  
798 **Average NAT Rating in Science, Mathematics and English.** The probability value of F statistic of 24.081  
799 is .000, which is less than .05 level of significance. Thus, the null hypothesis is rejected. This signifies that  
800 there is a significant relationship between the set of independent variables (i.e. school type, teacher's  
801 attitude and motivation, family background and parental involvement, and length of service) and the  
802 dependent variable (Average NAT Rating in Science, Mathematics and English). Moreover, multiple R of  
803 .778 means that there is a high correlation or marked relationship of the predictor variables (i.e. school  
804 type, teacher's attitude and motivation, family background and parental involvement, and length of  
805 service) on the Average NAT Rating in Science, Mathematics and English.  $R^2 = .605$  or 60.5% of the total  
806 variation in the average NAT rating in Science, Mathematics and English is explained by its linear  
807 function of school type, teacher's attitude and motivation, family background and parental involvement,

808 and length of service. In other words, 39.5% of the entire variation of average NAT rating in Science,  
809 Mathematics and English is not accounted to the variation of the school type, teacher's attitude and  
810 motivation, family background and parental involvement, and length of service. This suggests that there  
811 might be some other factors which influence the average NAT rating in Science, Mathematics and  
812 English.

813  
814 The unstandardized coefficient of school type, teacher's attitude and motivation, family background and  
815 parental involvement, and length of service obtain t-values with Sig. values of .000, .002, .019, and .031,  
816 respectively. All Sig. values are less than .05 level of significance. It denotes that the average NAT rating  
817 in Science, Mathematics and English is significantly predicted by school type, teacher's attitude and  
818 motivation, family background and parental involvement, and length of service. Furthermore, the  
819 empirical model is  $Y_{\text{NATAverage}} = 60.645 - 26.052 * \text{School Type} + 8.362 * \text{Teacher's Attitude and Motivation}$   
820  $- 4.902 * \text{Family Background and Parental Involvement} + 4.158 * \text{Length of Service}$ .

## 821 DISCUSSION

822  
823  
824 **Teacher's Demographics.** The demographic profile of the teachers affects their performance in school. If  
825 the teacher performs well in school then students also achieve a quality performance. Based on the  
826 International Journal of Education and Research Vol. 1 No. 3 March 2013 by [Kimani et al. \(2013\)](#) that the  
827 teachers cannot be dissociated from the schools they teach and academic results of schools. It would  
828 therefore be logical to use standardized students' assessments results as the basis for judging the  
829 performance of teachers. Based on the result, the population of the female teachers dominated. It  
830 means that there are more female teachers than male. However, gender does not affect the teacher's  
831 performance. This is supported by result of the study of [Kant \(2014\)](#) who states that there is no  
832 significant difference between male and female secondary school teachers on role performance. In the  
833 civil status, teachers who are married are more affectionate towards their students. The employment  
834 status of the teachers is also a factor in their performance as [Darling-Hammond's \(2003\)](#) supports the  
835 premise that teachers are motivated to perform at higher levels and are more willing to stay with an  
836 organization if they are experiencing a high quality of work life.

837  
838 **Employment Status.** The employment status of the teachers is also a factor in the school's performance  
839 as [Darling-Hammond's \(2003\)](#) favors the premise that teachers are motivated to perform at higher levels  
840 and are more willing to stay with an organization if they are experiencing a high quality of work life.  
841 According to the informants, the stability of the teachers really affects their performance. When  
842 teachers are stable, it would reflect on their performance. Moreover, in the result of the study, it is  
843 evident that majority of the respondents have permanent employment status. Although there are  
844 contractual, substitute, and other forms of employment but so far there is no problem that emerged in  
845 this certain aspect of the teachers. The administration and the teachers were able to come up with their  
846 consensus in terms of their employment status.

847  
848 **Length of Service.** Length of service is the period wherein the teachers are exposed in teaching.  
849 [Khurshid, Fauzia et al. \(2012\)](#) found that there is a positive relationship between teachers' self-efficacy  
850 and their job performance. In this study, the majority of the respondents and informants belong to the  
851 0-5 years of experience in teaching while only few from 6-10 years and as well as in the 11 years above.  
852 According to [Kant \(2014\)](#), the role performance of secondary school teachers did reveal significant  
853 positive relationship with their teaching experience. This is also true to the result of this study. As the  
854 informants revealed that the longer the experience they have in the field of teaching, the more effective

855 they are in terms of their performance. Further, teachers who belonged to the 0-5years of experience  
856 stated that they are challenged to perform better.

857

858 **Educational Attainment.** The educational attainment of the teacher is also vital in their performance. In  
859 the study of Rivkin et al. (2005), they stated that we do not focus solely on measurable characteristics of  
860 teachers or schools as is typically done in this literature but instead rely on student outcomes to assess  
861 the magnitude of total teacher effects, regardless of our ability to identify and measure any specific  
862 components. This semi-parametric approach provides both an estimate of the role of teacher quality in  
863 the determination of academic achievement and information on the degree to which specific factors  
864 often used in determining compensation and hiring explain differences in teacher effectiveness.  
865 However, according to Kant (2014), there is significant positive relationship between role performance  
866 and educational qualification of secondary school teachers. It means role performance of secondary  
867 school teachers did reveal significant positive relationship with their educational qualification. The  
868 results of this study confirmed that of Kant. Although it appears that the number of the respondents  
869 that get high response is teachers who have Bachelor's degrees but it can also be observed that the  
870 numbers who have Master's degrees is not quite far from that result. Informants also affirm that their  
871 performance in school is affected by their educational qualification. They further state that the higher  
872 the education they have achieved, the more knowledgeable they are in their field of expertise and the  
873 more competent they are in their performance. Additionally, they also reveal that there are so many  
874 things that they will learn in their graduate studies that they could readily share to the students.

875

876 **Vertical Alignment.** In the field of teaching especially in the K – 12 curriculum, it is important that the  
877 subject taught or assigned to the teacher is aligned with the course the teacher took up. Informants  
878 stated that *you cannot give what you do not have*. Further, this statement is strengthened by another  
879 informant who states that it is not effective if the teacher is forced to teach the subject which is not his  
880 field of expertise. Additionally, the informants also shared that they were forced to teach the said  
881 subject due to the lack of teachers. Though they said that they also tried their best to perform well but  
882 it was a struggle for them. They could not focus on the said subject. The quantitative result reveals that  
883 majority of the respondents are vertically aligned with their course. It means that it is very important  
884 that teachers should teach in their field of expertise.

885

886 **Field of Specialization.** The teachers could perform well if the subject that they are handling is their field  
887 of specialization. It is easy for them to convey the teaching since it is their field of expertise as the  
888 informant had stated. Furthermore, the informants said that they could freely think of activities that  
889 best suit the topic because they are well-versed with the subject. The result of this study is not alarming  
890 because it is manifested that most of the teachers fall in their field of expertise.

891

892 **School Profile.** School profile is also a factor in the school performance. As the informants said that they  
893 are more likely to belong in a small school because in the small school they do not have difficulty in  
894 dealing with their administrator, co-teachers and also the students. In big schools, the teachers and  
895 administrators usually have difficulties in resolving issues that arise.

896

897 **Class Size.** Class size also matters in the performance of the school. According to Yelkpiieri et al. (2012)  
898 that some of the key findings of the study are that lecturers disagreed with the view that large class size  
899 affects the quality of teaching. In addition, they also disagreed with the assertion that large class size  
900 makes assessment of students difficult. The students, on the other hand, agreed that large class size  
901 does not afford lecturers an opportunity to pay attention to weaker students and do remedial teachings.  
902 However, based on the result of this study, class size really matters in terms of conveying the lesson to

903 the students. Further, according to the informants that the higher the number of students, the lesser  
904 the learning and the lower the number of students, the higher the learning. Additionally, they state that  
905 when the number of students in the classroom is lesser, it is manageable and learning is very evident.  
906 Hence, this study affirms [Yelkpiri et al. \(2012\)](#) when the students agreed that large class size does not  
907 afford lecturers an opportunity to pay attention to weaker students and do remedial teachings. It is  
908 further supported by [Graue et al. \(2009\)](#) who state that they present multiple vignettes to illustrate that  
909 class size reduction provides opportunities that can be activated by organizing and implementing high-  
910 quality classroom practices.

911 **School Type.** There are two types of school included in this study, the public and the private school. The  
912 informants said that there is a difference in terms of the performance of the students. They said that in  
913 private schools, they can concentrate and focus on their students because of a smaller population unlike  
914 in public schools wherein the population is at the maximum classroom requirements or even beyond the  
915 number of students.

916 **Teacher Factor.** Teachers are one of the main ingredients in learning. They are the purveyor of  
917 knowledge to the students. [Kimani et al. \(2013\)](#) have cited the following: [Rivkin, Hanusheck and Kain  
918 \(2005\)](#), there have never been a consensus on the specific teacher factors that influence students'  
919 academic achievement. [Akiri and Ugborugbo \(2008\)](#) found that there was a significant relationship  
920 between teachers' gender and students' academic achievement. This is contrary to [Dee as cited in Akiri  
921 and Ugborugbo \(2008\)](#). [Yala and Wanjohi \(2011\)](#) and [Adeyemi \(2010\)](#) found that teachers' experience  
922 and educational qualifications were the prime predictors of students' academic achievement. However,  
923 [Ravkin et al. \(2005\)](#) found that teachers' teaching experience and educational qualifications were not  
924 significantly related to students' achievement.

925  
926 **Teacher's Expertise.** Teachers are conveyors of knowledge. They are responsible from the theory to the  
927 applications of the learning of the students. [Kant \(2014\)](#) shows that there is significant positive  
928 relationship between role performance and teaching experience of Secondary School Teachers. This  
929 means role performance of secondary school teachers does reveal significant positive relationship with  
930 their teaching experience. Kant further states that more experienced teachers have better role  
931 performance than less experienced. Based on the result of this study, the informants stated that  
932 teachers should have enough knowledge to execute something. This also means that the need for the  
933 teachers to be expert in the subject matter is often true.

934 **Teacher's Attitude and Motivation.** The students become highly motivated and eager to learn if they  
935 see that teachers also are willing to impart their knowledge to them. In the study of [Bahamonde-  
936 Gunnell \(2000\)](#), he found that teachers who were satisfied with their jobs had more positive views about  
937 school climate than those who were not satisfied. It was supported by [Kameshwar \(2012\)](#) in which he  
938 found out that the attitude of secondary school teachers are more stable and reliable than the primary  
939 and higher secondary school teachers and college teachers. Furthermore, according to [Wirth & Perkins  
940 \(2013\)](#) indicated that teacher's attitude contributed significantly to student attention in classrooms.

941 **Teacher's Attitude and Motivation.** [Mustafa and Othman \(2010\)](#) examined the perceptions of high  
942 school teachers about the effects of motivation on their performance at work. They found that there is a  
943 positive relation between motivation and working performance of teachers, i.e., the greater the level of  
944 motivation the higher is the teacher's job performance or if provide a high level of motivation to a  
945 teachers then their job performance will be increased. This study affirms the above statement.  
946 Informants have said that they are true to their commitment and when it comes to teaching, they are  
947 fully energetic, dynamic and full of enthusiasm.

948

949 **Teacher's Trainings and Advancement.** Teachers are like pencils. They need to be sharpened from time  
950 to time in order to get a better output. Kant (2014) states that those teachers who are more qualified  
951 show more positive relationship because more teachers gain knowledge more they show responsibility  
952 towards their profession. The result of this study also tells the same. The informants said that they have  
953 attended seminars especially in preparation for the K-12 curriculum.

954 **Teacher's Teaching Strategies and Methodology.** The teaching strategies and methodology are the two  
955 factors that highly influence learning. Knobloch (2003) states that making a difference to students'  
956 learning may be linked to effective teaching. Additionally, Aguele (2004) states that the supervision of  
957 students' activities has large impact on their overall acquisition and improvement of basic skills. Further,  
958 Chang (2010) adds that researchers have classified teaching styles in many ways and have considered  
959 certain teaching styles more effective in improving student learning. Based on the result of this study,  
960 teachers have different ways in their teaching strategies depending on the situation they are in or the  
961 students they have. Some informants said that they do have remedial classes, integrating the lesson in  
962 the real life situation and even performing the application of the theories and etc. they further said that  
963 students easily get bored if there is just one strategy that the teacher has to use. Thus, the quantitative  
964 analysis revealed that there is a higher level of agreement of teachers and principals on teacher's  
965 teaching strategies and methodology that are perceived to be associated with the performance of  
966 secondary schools in Science, Mathematics and English.

967 **Student Factor.** In the teaching learning process, the student factor is also observed. The result shows  
968 that student has a higher impact in the teaching-learning process.

969

970 **Student's Behavior.** The quantity of the knowledge that the students have gained depends on their  
971 behavior in the class. Flynt (2008) reveals that students who exhibit more off task behaviors are seen as  
972 being more hostile and requiring more attention. He also adds that students who exhibit positive  
973 behaviors generally have higher reading and math achievement scores than students who are perceived  
974 as exhibiting negative behaviors such as hostility or dependence. Based on the result of the study, the  
975 informants state that there are many factors that affect the students' behavior inside the class. They  
976 further say that nowadays, there are so many diversions that possibly affect the students' behavior like  
977 the mass media, computer games, peer influence, escaping from classes, chitchatting with friends while  
978 the class is ongoing.

979 **Student's Performance.** Akey (2006) states learning involves individual cognitive and emotional  
980 processes, student motivation is also significantly influenced by a supportive network of relationships.  
981 The likelihood that students get motivated and engaged in school is increased to the extent that they  
982 perceive their teachers, family, and friends as supportive. Further, based on her finding prior  
983 achievement is also significantly related to perceived competence, suggesting that students who do well  
984 on reading and mathematics assessment tests then perceive themselves as able learners, which  
985 promotes more reading and mathematics success. This study also affirms the said finding. The  
986 informants state that students are matured enough, participative and they know how to communicate  
987 well with their teachers. It is strengthened with the quantitative result which shows that there is a high  
988 response in terms of the students' performance in school.

## 989 **Learning Resources and Classroom Management**

990 **Learning Resources Management.** Learning resources management is very essential in measuring the  
991 school's performance. According to Sood (2000), at a bare minimum level, schooling would require a  
992 building; some provisions for seating children, drinking water, and sanitation facilities, teaching material;

993 teachers and provision for upgrading skills of teachers. Lack of any of these would find the schooling  
994 experience ineffective. Moreover, Idowu (2012) observes that if all the resources allocated to the  
995 schools are prudently managed, it would lead to school efficiency in terms of good student learning  
996 outcomes. Based on the result of the study, the informants said that the learning resources should be  
997 looked into if the school aims to have a quality education. They also state that if the school could not  
998 provide the learning materials then the teacher must learn to improvise in order to have an effective  
999 output. Further, they also reveal that their school is being sponsored by private people who extend their  
1000 hands by donating learning resources like televisions and projectors.

1001  
1002 **Classroom Management.** The effectiveness of teaching-learning process also depends on the classroom  
1003 management. The comfort the students inside the class, the proper ventilation, the instructional  
1004 materials are part of the classroom management. In order to have a quality output, these things should  
1005 be properly observed. Based on the study, the classroom management gets only an average score.  
1006 Based from the study of Jalali et al. (2014), as cited from Everstone and Weinstein (2006) classroom  
1007 management can be defined as “the actions teachers take to create an environment that supports and  
1008 facilitates both academic and social emotional learning.”

1009 **Management and Governance.** The success of the educational process also depends on how the  
1010 administration handles the school. As the quantitative result showed that there is an average level of  
1011 agreement of teachers and principals on school based management that is perceived to be associated  
1012 with the performance of secondary schools in Science, Mathematics and English.

1013  
1014 **Relationship to and Among Stakeholders.** There should be harmonious relationship among  
1015 stakeholders because they are the recipient of the product of the school. As the informants says that the  
1016 good relationship towards the stakeholders should be maintained.

1017 **Principal’s Projects and Programs.** The school principal has projects for the welfare of the school, the  
1018 community, the faculty and most especially the students. According to the informants, there are  
1019 programs from their principal like feeding for those students who are less fortunate so that they could  
1020 focus on their studies. They also add that there are also trainings and seminars for the teachers for their  
1021 professional growth. Moreover, the parents are also given seminars.

1022 **School Based Management.** Chika and Ebele (2008) emphasize that principals play their instructional  
1023 leadership roles to high extent and these roles affect the work performance of their teachers. This study  
1024 affirms the said statement. Informants say that their principals have different ways in handling them.  
1025 There are principals who have programs like adopt-a-student program wherein the less fortunate  
1026 students or poor but deserving students will be adopted by the teachers. Further, there are also  
1027 principals who observe classes regularly despite their hectic schedules and they are also given advice on  
1028 what to do with their subjects.

1029  
1030 **Family Background and Parental Involvement.** Ademola and Olajumoke(2009) as cited from (Gianzero,  
1031 2001) mention that by encouraging their children and assisting on homework, parents can set example  
1032 for their child, which is powerful and positive. Utah Education Association (2008) asserts that when  
1033 parents are involved in their children’s education at home, they do better in schools. Conway and  
1034 Houtenwille (2008) also discover that parental involvement has a strong positive effect on student  
1035 achievement. The results of the Ademola and Olajumoke (2009) study imply that parental involvement  
1036 is important in enhancing pupils’ achievement in Mathematics and Science. It concludes that the higher  
1037 the parental involvement, the higher the achievement in Science and Mathematics.

1038

1039 **Family Background.** Additionally, family background could also affect the performance of the students  
1040 in school. As to the result of this study, informants say that poverty is one of the factors that hinders the  
1041 focus of the students towards their studies.

1042 **Parental Involvement.** It is assumed that academic achievement of students may not only depend on  
1043 the quality of schools and the teachers, rather the extent of parental involvement has vital role to play  
1044 in academic achievement of their kids (Rafiq et al. 2013). They further state that parental involvement in  
1045 school has been linked with academic achievement. Although little research has been done in the area  
1046 of parental involvement and secondary school students, the literature review examines the many  
1047 factors that may contribute to the level of parental involvement and academic achievement in  
1048 secondary school. As cited by Rafiq et. al (2013) from Henderson and Mapp (2002) they state that  
1049 parents play a crucial role in both the home and school environments. In general, parental involvement  
1050 is associated with children's higher achievements in language and mathematics, enrolment in more  
1051 challenging programs, greater academic persistence, better behavior, better social skills and adaptation  
1052 to school, better attendance and lower drop-out rates. The result of the study affirms the statements  
1053 above. Based from the informants' responses, they explain that those students who are well supported  
1054 by their parents have the high motivation in going to school.

## 1055 1056 **CONCLUSIONS/IMPLICATIONS**

1057 Based on the significant findings of the study, the following conclusions are drawn. The null hypotheses  
1058 are rejected on the following grounds:

1059  
1060 On demographics, educational attainment and vertical alignment have significant influence on  
1061 competitions; marital status, employment status and length of service on NAT results in Science; marital  
1062 status and length of service on NAT results in Mathematics; and marital status and length of service on  
1063 average NAT result. It implies that if a teacher desires to win in competitions, he has to go to school for  
1064 master's degree or doctoral degree in line with his major in bachelor's degree.

1065  
1066 On school factor, school type has a significant influence on NAT results in Science; school size, class size  
1067 and school type on NAT results in Mathematics; school size on NAT results in English; and school size,  
1068 class size and school type on average results. It implies that the school size and class size matter in the  
1069 NAT results.

1070  
1071 On teacher factor, teacher's attitude and motivation, teacher's trainings and advancement, and teacher  
1072 factor as a whole have significant influence on NAT results in Science; teacher's attitude and motivation  
1073 and teacher factor as a whole on NAT results in Mathematics; teacher's attitude and motivation,  
1074 teacher's teaching strategies and methodology, and teacher factor as a whole on NAT results in English;  
1075 teacher's attitude and motivation on average NAT results.

1076  
1077 Learning resources and classroom management significantly influence competitions. It implies that if a  
1078 principal wants to have achievements in competitions he has to work on the facilities of the school such  
1079 as providing convenient chairs, proper ventilation, instructional materials (i.e. litmus paper, chemicals,  
1080 graphing boards, etc.), sufficient classrooms with audio-visual materials (i.e. TV set, LCD projector, etc.).  
1081 On the other hand, if the teacher wants to win competitions, he must have a good classroom  
1082 management, that is, he strictly implements rules and regulations inside the classroom, provides  
1083 activities during ICL time, reprimands students lightly and has a portfolio of students which is used to  
1084 address individual differences.

1085

1086 On management and governance, principal's relationship to stakeholders and management and  
1087 governance as a whole significantly influence competitions; principal's relationship to stakeholders on  
1088 NAT results in Science, in Mathematics and in average results; and principal's projects and programs and  
1089 school based management on NAT results in English. It implies that if the principal aims to win  
1090 competitions, he has to work on the harmonious relationship among stakeholders. If he desires better  
1091 NAT results he has to organize different programs and projects for the benefit of the students,  
1092 transparent to the appropriation and liquidation of the school's MOOE, strictly monitors the absences  
1093 and tardiness of the teachers, initiates the conduct of NAT and observe classes together with the master  
1094 teacher/department head.

1095

#### 1096 **RECOMMENDATIONS**

1097 Based on the foregoing results and conclusions, the following are recommended:

1098

1099 Principals should revisit the class scheduling and teaching loads of teachers to increase the number of  
1100 classes that reduces the number of students in every class, should allocate funds from MOOE for  
1101 sending teachers to trainings and for instructional materials, should encourage teachers to enroll in  
1102 master's degree in line with their major in their bachelor's, and should plan for activities that establish  
1103 harmonious relationship among teachers and other stakeholders such as team building activities.

1104

1105 The Division Office must initiate monitoring of the maintenance of school facilities and must provide  
1106 appropriation to building new classrooms, better facilities, better library materials, equipped science  
1107 and computer laboratories in every school.

1108

1109 DepEd supervisor and principal/head teachers should have a close monitoring regarding tardiness and  
1110 absences of teachers.

1111

1112 DepEd central, regional and division offices should organize and facilitate trainings and seminar-  
1113 workshop for teachers relative to teaching strategies, methodology and classroom management.

1114

1115 Teachers must be resourceful enough to look for reference books and the improvisation of the materials  
1116 to be used in the class instruction.

1117

1118 The principal in coordination with the PTA should strengthen school projects and programs particularly  
1119 those that facilitate the delivery of instruction.
