**ECONOMIC ANALYSIS OF SNAIL MARKETING IN IBADAN NORTH EAST LOCAL  
GOVERNMENT AREA OYO STATE, NIGERIA**

**Abstract**

This paper reports findings from a study carried out to investigate the profitability of snail marketing in Ibadan North East Local Government area of Oyo State. Structured questionnaires and interview schedules were designed to obtain information on socio-economic characteristics, operational capital and source, years of experience in the business and constraints to snail marketing. Seventy snail marketers, randomly selected from three major markets which are Oje, Agodi gate and Agugu market;. The data collected were analyzed using frequency table, percentage, gross margin, Benefit/ Cost ratio and Marketing Efficiency analyses. Majority (94.3%) of the respondents were female while 5.7% were male. 31.5% were between the ages of 51-60years with mean age of 54.9 years. It was also shown that 50% source their capital through personal savings between ₦11,000-₦20,000 and 47.1% with 5-9years experience. The cost and return analysis revealed that total revenue was ₦1, 457,700.00k and total cost was ₦1, 285,320.00k while gross margin was ₦172, 380.00k and benefit- cost ratio was 1.13 which implies that for every ₦1.00 invested the marketer will make a return of ₦1.13k on every snail sold, Marketing efficiency was 88%. Major constraints to snail marketing in the study area were poor market patronage (87.1%) and seasonality (82.9%). Snail farming is advocated since it is a profitable agribusiness and can be achieved through cooperatives and micro credit facilities. Also, marketing of snail in the area should be restructured and standardized to command frequent patronage and command higher price value.

**Keywords:** Economic, Ibadan North-East, Marketing, Oyo State, Profitability, Snail, Nigeria

## 25 **Introduction**

26 Snails are invertebrates and hermaphrodites which belong to phylum Mollusca and have a singular spiral  
27 shell into which the whole body can be withdrawn. The most popular snail in Africa is the Giant African  
28 land snail, *Achatina* species which grows up to 30cm in length and is usually found in the dense tropical  
29 rain forest region across Africa. They are one of the micro livestock that have recently attracted attention  
30 among farmers in Nigeria because of the Food and Agriculture Organization (FAO's) alert on the  
31 deficiency of animal protein among Nigerians (Adesope, 2000). The consumption of snail meat by rural  
32 communities is governed more by culture than by social status and it is confirmed by many researchers  
33 to have both nutritional and medicinal values Ebenso (2003). Snail meat is white meat though  
34 characteristically organic, but has similar taste and texture to that of seafood. Snail has great potentials  
35 in the tropics where it is widely used in human nutrition. Murphy (2001) analyzed and reported snail  
36 meat to be high in protein (37.51%) compared to that of guinea pig (20.3%), poultry (18.3%), fish  
37 (18%), cattle (17.5%), sheep (16.4%). Snails are low in fat, protein rich and a good source of variety of  
38 essential vitamins and minerals including magnesium, vitamin E and phosphorous (Akinnusi, 2002). It  
39 also has some medicinal purposes such as in the cure of heart and kidney diseases, stroke, high blood  
40 pressure, liver, fat related ailment, poor eye sight, small pox, ulcer, constipation and asthma (Ayodele  
41 and Asimolowo, 1999). Snails have been and are still a much sought after food and come to the table as a  
42 gastronomous delight.

43  
44 Snails can be found in a very wide range of environments mostly in the wild, including ditches and the  
45 bathyal depths of the sea. (Robinson, Elizabeth, 2005). Snail.world.com (2017) reported that snails are  
46 practically everywhere, but some have adapted to survive in water and some on humid land. They have  
47 adapted to a variety of conditions/habitats including villages, farms, backyards and sheds. In fact, people  
48 in the rural settings freely scout in the forests and farmlands to collect snails during the rainy season for  
49 sales and for domestic consumption. Snail farming is suggested to be amongst the top interesting

50 business opportunities in Africa because of its socio-economic importance. Snail marketing could serve  
51 as a source of income and returns to the marketers in the study area. The present study aims to  
52 investigate the profitability of snail marketing in Ibadan North East Local Government area of Oyo  
53 State.

#### 54 **Marketing Concept and Marketing Efficiency**

55 The American Marketing Association (2013) explained marketing as the communication between a  
56 company/ producer and the consumer. It is also an activity set of institutions and processes for creating  
57 communication delivery and exchanging offerings that have value for customers. Marketing concept  
58 therefore includes the assemble preparation for consumption and the final distribution. Kotler *et al.*,  
59 (2010), also defined market concept as achieving organizational goals which depend on knowing the  
60 needs and wants of target market and delivering the desired satisfaction. Marketing efficiency can be  
61 defined as the maximization of the ratio of output to input in marketing. Efficient marketing optimizes  
62 the ratio between inputs and outputs. Marketing inputs here include the resources used in marketing of  
63 products whereas marketing output is the benefit or satisfaction created or the value added to the  
64 commodity as it passes through the marketing chain. Therefore, for this study, value added by  
65 respondents is computed as price in naira received by the respondents (price paid by the consumers) less  
66 the price received by the preceding marketer in the supply chain. Therefore:  $M.E = [(Total\ revenue - purchase\ cost\ of\ snail) \div (Total\ cost\ of\ marketing)] \times 100\%$  as used by Ugwumba *et al.*, (2016). There  
67 are so many businesses in the study area which need to be critically assessed for their profitability status.  
68 It is on this premise that this study therefore investigated the economic analysis of snail marketing in  
69 Ibadan North East Local Government Area of Oyo State, Nigeria through examination of the socio-  
70 economic characteristics, cost and returns, constraints and efficiency of snail marketing in the study  
71 area.  
72

#### 73 **Methodology**

74 The study was carried out in Ibadan North East local government area, one of the LGAs in Ibadan  
75 metropolis of Oyo State. Ibadan is the capital of Oyo State, the largest city in Nigeria and Sub-Saharan  
76 Africa. It has a population of 330,399 at the 2006 census, and has the land mass of 125km<sup>2</sup> with twelve  
77 (12) wards. It is located on the northern part of Ibadan lying between latitudes 7<sup>0</sup>N and 9<sup>0</sup>N of the  
78 equator and longitude 3<sup>0</sup>E and 5<sup>0</sup>W Greenwich meridian. It has an average rainfall of between 1250mm  
79 and 1800mm and the temperature range is between 27<sup>0</sup>C and 32<sup>0</sup>C with relative humidity of 75% - 90%  
80 (NPC 2006).

### 81 **Sampling Procedure**

82 The sample for the study was obtained using multi-stage random sampling technique. In the first stage,  
83 Ibadan North East Local Government Area was purposively selected for the study because of the  
84 concentration of snail markets in the area. For the second stage, three major markets were randomly  
85 selected and these included Oje, Agodi and Agugu Markets. Lastly, twenty percent (20%) each, of the  
86 total population of snail marketers from the three major snail markets were then randomly selected as  
87 30, 15 and 25 respondents from 154, 77 and 126 snail marketers from Oje, Agodi-Gate and Agugu  
88 markets respectively. Therefore, a total of 70 respondents were randomly selected for the study.

89 Structured questionnaire and interview schedules were designed to seek information on the socio-  
90 economic characteristics of the marketers, operational capital, source of capital, years of experience in  
91 snail business and constraints to snail marketing.

### 92 **Method of Data Analysis**

93 The data obtained from the study were analysed using descriptive statistics such as frequency,  
94 percentages and mean. Also, inferential statistics like Gross Margin (GM), Benefit Cost Ratio (BCR)  
95 and Marketing Efficiency (ME)

96 The formulae used to compute Gross Margin (GM), Benefit Cost Ratio (BCR) and Marketing  
97 Efficiency (ME) are expressed in equations described by Oyewo *et al.*, (2013) given below:

98  $GM = TR - TC$  (1)

99 Where,

100 GM = Gross margin

101 TR (Total Revenue) = from the sales of snail = (P x Q)

102 Where P = Price of Snail; Q = Quantity of Snail sold

103 TC= Total Cost

104  $BCR = TR/TC$  (2)

105 Marketing Efficiency Index (MEI) as used by Olukosi and Isitor (1990) and Ekuwore *et al* (2008)

106  $Marketing\ Efficiency = \frac{Total\ Revenue}{Total\ Market\ Cost}$  (3)

107

108 If  $ER \leq 1$  ----- Market is operatively efficient

109 If  $ER > 1$  ----- Market is operatively inefficient

110

## 111 Results and Discussion

112 **Table 1: Socio-economic characteristics of the respondents (N=70)**

Variable	Frequency	Percentage (%)	Mean
Age (years)			
21-30	1	1.4

25 and above	1	1.5	8.77

113

114 From table 1, it can be revealed that 94.3% of the respondents were female while 5.7% were male. This  
115 indicates that snail marketing is essentially an activity carried out by women folks. This result shows  
116 that women were predominant in snail farming, indicating the importance of women in the marketing of  
117 snails. This agrees with the findings of Ebowore and Achoja (2013) who reported that majority of snail  
118 marketers were women in Delta State. Akinyemi *et al* (2003) also reported that more than half of snail  
119 marketers in Ibadan, Oyo State, Nigeria were women. 32.8% were above 61years and 31.5% were  
120 between the ages of 51-60years with mean age of 54.9years. This implies that people who engage in  
121 snail marketing were within the adult population. This finding disagrees with the report of FAO, (1994)  
122 that economically productive age is between 39 and 45 years. It was also found that 55.7% were  
123 Christians, 38.6% were Muslims while traditional religion worshipers were only 5.7%. 60% of the  
124 marketers were married; this shows that married people were more involved in snail marketing in the  
125 study area probably to increase household income. This is probably to increase the household income.  
126 This result corroborates the findings of Ebewore and Achoja (2013) that there were more married people  
127 involved in snail marketing in Delta State, The result also showed that 22.9% had no formal education,  
128 64.3% had primary education while 12.9% had secondary education. This means that education may add

129 value to the operation of the business. This agrees with Yusuf (2002) who reported that majority of the  
130 marketers of snails in Ibadan were educated.

131 Majority of the respondents (57.1%) had household size between 5-9 with mean household size of 5.39  
132 in the study. This may be used as family labour. 68.6% relied solely on snail marketing and this implies  
133 that they can provide for their family and live well through the business. Mafimisebi *et al* (2014)  
134 observed regarding the household size of cattle marketers in Oyo and Ondo axis and noted that 46.5% of  
135 the respondents had 5 of household size. This suggests that family members will be more committed to  
136 snail marketing as an economic venture from which income can be generated to sustain the family.

137 It is obvious that most of the respondents 50.0% use their personal savings as their source of capital. The  
138 table also shows that 48.6% of the respondent had income between ₦21,000 - ₦30,000 from the snail  
139 marketing business, implying that snail marketing is a profitable business which people can engage in.  
140 Majority (71.3%) started the business with an initial capital of between ₦11,000 - ₦20,000 this shows  
141 that one can start the business with little capital and earn profit. Years of experience in the business  
142 varied with 47.1% of the respondents had 5-9 years marketing experience; this implies that majority of  
143 the snail marketers had above 5 years marketing experience. The number of years in the business of  
144 snail marketing could enable them to know the best ways to make profit, the little secrets of the  
145 business. The presence or lack of experience showed low production and income of the farmers  
146 (Mafimisebi *et al.*, 2012).

147 **Table 2: Snails Marketing Channels in Ibadan North East LGA., Oyo State**

Variables (N=70)	Frequency	Percentage (%)
<b>Kind of Marketer</b>		
Wholesaler	60	85.7
Retailers	8	11.4

Assemblers	2	2.9
<b>Source of Snail</b>		
Producer	60	85.7
Hunters/Gatherers	5	7.1
Wholesalers	5	7.2
<b>Sale target</b>		
Retailer	10	14.3
Consumer	60	85.7
<b>Measurement of Purchase</b>		
Pieces	46	65.7
Congo	16	22.9
Basket	8	11.4
<b>Measurement of Sale</b>		
Pieces	36	48.6
Congo	34	51.4

148

149 Majority (85.7%) of the marketers were wholesalers, 11.4% were retailers while only 2.9% of the  
 150 respondents were hunters/gatherers (Table 2). 85.7% were snail producer and sold directly to consumers.  
 151 This could be due to the richness in protein and other medicinal values in snail consumption. It is  
 152 important to note that snail is not a commonly consumed meat but rather on need for meeting some  
 153 nutritional or medical requirements and also, because of affordability mainly by the rich in the study.

154 **Table 3: Cost and Return on Snail Marketing**

Variable	Amount (₦)
Total revenue (TR)	₦1,457,700.00k
Average Total Revenue	₦2,462.57k
Fixed cost (FC)	₦1,193,500.00k
Other expenses	₦23,570.00k
Transportation cost	₦68,250.00k
Total Cost	₦1,285,320.00k

155

156  $TC = \text{Transportation Cost} + \text{Fixed Cost} + \text{Other Cost}$

157  $= \text{₦1, 285,320.00}$

158  $TR = \text{₦1, 457,700.00}$

159  $GM = TR - TC$

160  $= \text{₦1, 457,700} - \text{₦1, 285,320}$

161  $GM = \text{₦172, 380.00}$

162 Benefits Cost Ratio (BCR) =  $\frac{\text{Total revenue}}{\text{Total cost}}$

163

164  $BCR = \frac{\text{₦1, 457,700.00k}}{\text{₦1, 285,320.00k}}$

165  $BCR = 1.13$

166 Marketing Efficiency (ME)

167  $ME = \frac{TC}{TR} \times 100$

168

169 Therefore  $ME = \frac{\text{₦1, 285,320.00k}}{\text{₦1, 457,700.00k}} \times 100$

170  $\frac{\text{N}1,457,700.00\text{k}}{1}$

171 ME = 88.1745%

172 From the result of cost and return analysis, it was revealed that total revenue was N1,457,700.00k and  
173 total cost was N1,285,320.00k. The gross margin was N172,380.00k and also the benefit cost ratio was  
174 1.13. This result reveals that for every N1.00k invested in snail marketing, the marketer will make a  
175 return of N1.13k. The marketing efficiency result shows that the snail marketing in the study area attains  
176 an optimal level of efficiency of 88%. The result shows that the snail marketing is efficient and this  
177 agrees with Oladejo (2014) who reported M-E of 1.17 for goat in Oyo State as profitable and so  
178 suggesting that snail marketing is profitable in the study area. Mafimisebi *et al.*, (2013) also reported a  
179 similar result as being profitable.

180 **Table 4: Constraints to Snail Marketing in the Study Area**

Variables	Frequency	Percentage (%)	
Poor Market patronage	61	87.1	1 <sup>st</sup>
Seasonality	58	82.9	2 <sup>nd</sup>
Numerous Sellers	57	81.4	3 <sup>rd</sup>
Finance	55	78.6	4 <sup>th</sup>
Price	42	60.0	5 <sup>th</sup>
Perishability	33	47.1	6 <sup>th</sup>

181  
182 Snail marketing in the study area was hindered by several factors including lack of market, numerous  
183 sellers, weather, finance, price, perishability (Table 4). The finding shows that poor market patronage  
184 was mostly identified probably because people eat snail on recommendation to meet some nutritional or  
185 medical needs, for cultural or traditional uses since it is a bit costlier than other meat sources. So, snail is  
186 ordinarily consumed by relatively rich people in the study. This however supports the work of

187 Ugwumba *et al.*, 2016) who reported seasonal nature, high and unstable price of product, poor sales and  
188 lack of capital as major constraints to the marketing of African giant snail. Snail marketers should  
189 therefore design some business strategies such as lunching out (outside their immediate market area) to  
190 sell their produce in order to attract higher and better value.

## 191 **Conclusions and Recommendations**

192 Snail marketing according to this study is a profitable agribusiness in the area assessed since the  
193 benefit/cost ratio is greater than 'one' as confirmed by Ogunniyi, L. T (2009) and, Aiyelaja and  
194 Ogunjinmi (2010) who see snail marketing as a profitable agribusiness but however below poverty line..  
195 The level of profitability can however be increased if there are other sources of collecting snails rather  
196 than from the wild. The marketers of snails can also rear snail at household level, practice/establish snail  
197 farms on small, medium or large scales in order to increase the level of production. Soft loans and credit  
198 facilities through cooperatives, micro-finances and Government sources will help in boosting the  
199 market.

200 Profitability of the business in this study is an eye opener for individuals, Government and NGOs to  
201 consider snail farming and marketing for youth empowerment. Empowerment of youths in snail farming  
202 and marketing with provision of credit facilities to maintain the farms by individuals, Government and  
203 NGOs in order to generate revenue and reduce unemployment of youths in the society, is recommended.  
204 Future researches should be conducted into the advancement of snail marketing in order to command  
205 higher value.
