

Original Research Article

EFFECTIVENESS OF STRATEGIC INTERVENTION MATERIAL IN MATHEMATICS AS REMEDIATION FOR GRADE 9 STUDENTS IN SOLVING PROBLEMS INVOLVING QUADRATIC FUNCTIONS

Abstract

This study investigated the effectiveness of Strategic Intervention Material (SIM) in Mathematics as remediation for Grade 9 students in solving problems involving quadratic functions. The SIM was designed as a remediation tool for students in teaching one of the least learned competencies. It was personally conducted by the researcher in Digos City NHS – Igpit HS Annex, City Schools Division of Digos, Philippines, during the School Year 2016-2017. A total of 16 Grade 9 students were the participants of the study. Pretest-postest quasi-experimental design was used. The data were gathered using the researcher-made academic achievement. Mean and standard deviation were used to describe the data. One-way analysis of co-variance (ANCOVA) was utilized to test if the significant difference existed between the experimental and the control groups. Findings revealed that the academic achievement of Grade 9 students when remediated using the SIM was “satisfactory”; while the students remediated with the Grade 9 Learner’s Material was described as “did not meet expectations.” A significant difference in the academic achievement of students on the topic in favor of the experimental group was noted; hence, the Strategic Intervention Material in Mathematics was found effective as a remediation tool for Grade 9 students in solving problems involving quadratic functions. Recommendations of the researcher were offered.

Keywords: Strategic intervention material, Remediation, Mathematics, Quadratic functions, Problem solving

INTRODUCTION

Low performance of students poses a significant challenge to the education arena. Amidst the technology advancement in solving daily problems, basic knowledge of this technology is vital in its success. Gaining basic knowledge starts in school. Study of mathematics primarily needs conceptual understanding. Based on observation, students can read mathematical concepts but they can hardly comprehend and understand them. Hence the quality of mathematical skills being taught in schools is one of the primordial concerns of education. According to Ramirez *et al.* (2013), it was common to perceive mathematics as a difficult subject and some students avoided solving mathematical problems. Many learners experienced mathematics anxiety in their school lives.

43 Eyed as a long term solution, a curriculum transition from 2002 Basic Education Curriculum to K
44 to 12 Curriculum (Department of Education, 2012) had been taking place starting School Year
45 2012-2013 and was made legal by the Republic Act 10533 or the Enhanced Basic Education Act
46 of 2013. This curriculum reform had introduced many revisions and innovations such as the
47 incorporation of multiple disciplines in one subject.

48
49 In 1999, 2003, and 2007, Trends in International Mathematics and Science Study (TIMSS)
50 revealed unsatisfactory results of the Philippines in Science and Mathematics and they both
51 ranked below international standards (Martin, Mullis & Chrostowski, 2004). The same scenario
52 is true in the 2013 National Achievement Test (NAT) results where Mathematics had a very low
53 MPS of 42.35% (Philippine Education for all 2015 National Review Report). In School Years
54 2013-2014 and 2014-2015, NAT results in Mathematics for Southern Mindanao Region (Region
55 XI) showed an MPS of 35.67% and 38.79% respectively making Mathematics as one of the
56 lowest performing subjects. Furthermore, Digos City Division NAT results in Science of the same
57 school years revealed an MPS of 36.27% and 39.24% respectively (Region XI Institutional
58 Performance Profile SY 2014-2015). The said results nailed Digos City Division as the second
59 lowest ranking division in the whole region for Science and Mathematics and the lowest ranking
60 division in all five core subjects at the same time. Note that the students who took the said test
61 were in fourth year level under the old curriculum whose approach in Mathematics was not yet
62 spiral. The National Achievement Test results for the last five years showed that mathematics
63 got the lowest mean percentage score compared to other subjects (Department of Education,
64 2014).

65
66 Time for successful remediation is more difficult and more costly, making it closely impossible
67 to be facilitated (Aguele, 2010) considering that teachers and students are also pre-scheduled
68 to regular classes (DO No. 31, s. 2012; DepEd Memorandum No. 291, s. 2008). However, this is
69 not the case in Digos City NHS – Igpit HS Annex since one hour each day is allotted for remedial
70 classes.

71
72 Long before the advent of K to 12 Basic Education Program, intervention materials are highly
73 regarded as tools for remediating poor achievements of the learners. Thereafter, Strategic
74 Intervention Materials or SIM was introduced into the teaching methods to stimulate the
75 activity of the students and thereby increase their level of understanding (Dy, 2011). It is
76 strategically prepared and designed for teaching remediation for low achievers in the subject.
77 The same is given after a regular classroom instruction to students who were not able to grasp
78 the concepts of a subject matter (Barredo, 2013; and Salviejo, Aranes & Espinosa, 2014).

79
80 In the past three quarters of School Year 2016-2017, the researcher had observed that
81 remediation as part of addressing learning gaps and other deficiencies in learning produced
82 positive effects. The one hour teaching-learning interaction in the classroom is not enough for
83 the slow learners to grasp the concept. This raises a big concern on how students can maximize
84 learning.

85

86 The researcher is primarily interested in identifying the least learned competencies in
87 Mathematics and finding a way to address this problem. The goal of the study is to determine
88 the effectiveness of the SIM as a remediation tool for the Grade 9 students so as to enhance
89 their skills in solving problems involving quadratic functions, this being one of the least
90 mastered competencies in Grade 9 Mathematics.

91

92 **LITERATURE REVIEW**

93

94 **Strategic Intervention Material**

95 Strategic Intervention Material (SIM) refers to a teaching aid introduced into the teaching
96 methods to stimulate the activity of the students and thereby increase their level of
97 understanding (Dy, 2011). It tends to reteach the lessons which are not clear to the learners
98 and help them gain mastery of the skills (Rodrigo, 2015). SIM is designed to (a) remediate the
99 learners especially in the least learned competencies; (b) engage the learners through
100 interesting activities; (c) capture learners' interest by making the material pleasing to the eyes;
101 and (d) encourage the learners to think more, do more, and learn more.

102

103 Strategic Intervention Material (SIM) is an instructional material meant to re-teach concepts
104 and topics which are considered least learned by the students who are working below national
105 expectations but have the potential to meet national standards if given timely support and
106 motivation (Barredo, 2013; Salviejo, Aranes & Espinosa, 2014). It is a teaching-learning kit
107 devised for the benefit of both teachers and pupils. Its goals are to encourage pupils' interest;
108 learn Mathematics concepts and skills; and apply learned skills and concepts into real life
109 situations. SIM is believed to be an effective strategic teaching aid for teachers in
110 carrying out objectives on least learned lessons (Dy, 2011).

111

112 At present, in the Philippine education system, intervention materials are highly regarded as
113 tools for remediating poor achievements of the learners (Salviejo, Aranes & Espinosa, 2014). It
114 is strategically prepared and designed for teaching remediation for low achievers in the subject.
115 The same is given after regular classroom instruction to the students who were not able to
116 grasp the concept of the subject matter (Banugan, 2012). It consists of both learning strategies
117 (for students) and content enhancement (for teachers). It is multifaceted approach to help
118 students to become independent and successful learners.

119

120 Furthermore, SIM is an instructional material prescribed by the Department of Education to
121 improve students' performance in Mathematics subjects. To promote successful learning in the
122 field of Science and Technology subjects in both elementary and secondary among public
123 schools, Department of Education (2005) provided the teachers with training and workshop on
124 how to prepare this intervention material. As part of promoting the wide use of the material,
125 the Department of Education included SIM making that is open to all Math teachers as one of
126 the contests in the yearly Mathematics fair in the school, division, region, and national level
127 competitions.

128

129 Recent studies revealed that developing SIMs can be very adequate in content accuracy, clarity,
130 and appropriateness in presenting the Mathematics concepts (Dedace, 2014). SIM can also be
131 very acceptable, applicable, and useful to the potential users. Regarding the use of SIM in
132 Mathematics IV for the fourth year students, Soriano (2012) revealed that the students easily
133 mastered the least learned topics. Furthermore, Blalock (2010) described SIM as a competency-
134 based academic support approach that can help students in upper elementary, middle high
135 school, and higher education become independent and successful learner.

136
137 A study conducted by Escoreal (2012) on the SIM tool to reduce least mastered skills in Grade 4
138 Mathematics, reveals that SIM provides baseline information and should be implemented to
139 avoid marginalization of pupils. Her study also indicated that there is a significant reduction in
140 the pupil's mean number of least mastered skills after SIM implementation. Furthermore,
141 Soberano (2009) mentioned that SIMs were effective in mastering the competency based-skills
142 in math based on the mean gain scores in the post tests of the experimental and control
143 groups. As per result, higher mean was observed from the experimental group after the
144 presentation of the intervention materials. This suggested that there was significance
145 difference between their mean scores in the post test in favor of the experimental group. Also,
146 Barredo (2013) stressed, in her study entitled "Evaluating the Effectiveness of Using Strategic
147 Intervention Material in Improving the Academic Performance in Science", that Strategic
148 Intervention Materials were effective in mastering the competency based-skills in science based
149 on the mean gain scores in the posttest of the experimental and control groups.

150
151 Based on the presented information from different sources, one way to improve student
152 performance specifically in the least mastered skills of the subject area, is the utilization of an
153 instructional material. The use of Strategic Intervention Material (SIM) as prescribed by the
154 Department of Education is one of the treatments to improve students' achievements and
155 reduce least mastered skills in Mathematics subjects. Different studies have shown that the use
156 of SIM successfully decreased the least mastered skills in Mathematics subject; thus, poor
157 performance is addressed.

158
159 According to Dy (2011) achievement of the students who were exposed to the Strategic
160 Intervention Materials (SIMs) is higher and better compared to the students taught in the
161 traditional approach. The 75 percent proficiency/performance level required in any subject area
162 has been attained in the experimental group. There is a significant difference in the
163 achievement of the students in the control group and experimental group. This suggests that
164 the Strategic Intervention Materials (SIMs) be adopted as instructional materials for teaching
165 Mathematics to facilitate and improve performance.

166
167 The criteria and areas to be considered in making Strategic Intervention Materials in
168 Mathematics is emphasized in DepEd Memo No. 225, s. 2009 enclosure No. 2. The parts of the
169 SIM are title card, guide card, activity card, enrichment card, assessment card, and reference
170 card. SIMs guarantee alignment of activities with the tasks/objectives, keep the activities short
171 and simple, provide a variety of activities to cater to the diverse learners; provide number of

172 activities so that the learner can have enough practice in developing the skill and focus on the
173 least mastered skills.

174
175 Furthermore, the SIM topics should be competency-based specifically least mastered
176 competencies and follow the Bloom's taxonomy guidelines. Activities must be in line with the
177 content and skills, validated before the classroom use and are easy to copy. Materials used
178 must improve mastery level and increase students' academic achievement.

179
180 **Students' Academic Performance**
181 Student performance has dominated current discussions on educational matters and many
182 believe that the new curriculum is not yet absorbed in schools and consequently student
183 performance leaves much to be desired (Mahlo & Taole, 2015). They further emphasized that
184 this has resulted in finger pointing among stakeholders. However, the fact of the matter is that
185 something should be done to improve the current status quo. Everyone has a right to basic and
186 further education and thus all children and youth must have the entitlement to learn but they
187 need support. This implies that every student has the potential to learn and become a
188 responsible citizen if given a conducive atmosphere.

189
190 In accordance with Philippine national policy, Mathematics is taught in English. However, many
191 children from poor families have little knowledge of English and it is recommended that
192 instruction begin "with an assumption of zero knowledge." It is within this background that the
193 investigation of student performance in the domain of word problems form an integral part of
194 the Philippine Mathematics curriculum (Department of Education – Bureau of Elementary
195 Education, 2003). Filipino children find word problems difficult and the language factor is
196 identified as one of the "what-else-is-new" reasons for student failure (Philippine Executive
197 Report on the TIMSS). It is also a well-known fact that word problems in English are more
198 difficult for children who are still in the process of learning English than for native English
199 speakers (Martiniello, 2008).

200
201
202 **Research Questions**
203 The study investigated the effectiveness of Strategic Intervention Material in Mathematics as a
204 remediation for Grade 9 students of Digos City NHS – Igpit HS Annex.
205 Specifically, this study sought to answer the following questions:

- 206 1. What is the academic achievement in Quadratic Function of students using the SIM and
207 the Grade 9 Learner's Material in Mathematics as remediation tool?
- 208 2. Is there a significant difference in the academic achievement in Quadratic Functions
209 between the students with SIM as remediation tool and of the students with Grade 9
210 Learner's Material in Mathematics as a remediation tool?

211
212 **Theoretical Framework**
213 The theories anchored to this study are twofold. First is what Bruner (1961) as cited by David
214 (2017) in his Discovery Learning Theory or Inquiry Method/ Theory of Instruction that posits
215 that learning is more meaningful to learners when they have the opportunity to discover on

216 their own the relationships among the concepts or to actively search for a solution to a
217 problem. This theory is an approach to instruction through which the students interact with
218 their environment by exploring and manipulating objects, wrestling with questions and
219 controversies or performing experiments. Furthermore, the proponents of this theory believe
220 that discovering learning encourages active engagement, promotes motivation, promotes
221 autonomy, responsibility and independence, develops creativity and problem solving skills, and
222 tailors learning experiences. The idea is that students are more likely to remember concepts
223 they discover on their own. Bruner (1961) calls his view of learning “instrumental
224 conceptualism.” Second is Ausubel’s (1963) Meaningful Verbal Theory that asserts meaning is
225 created through some forms of representational equivalence between language and mental
226 context. There are two processes involved: first is reception, which is employed in meaningful
227 verbal learning; and second is discovery, which is involved in concept formation and problem
228 solving.

229

230 **METHOD**

231

232 **Research Design**

233 Pretest-posttest quasi-experimental design was used in this study. Two groups of subjects were
234 used, with both groups being measured twice. The first measurement served as the pretest
235 and the second measurement served as the posttest. Random assignment was used to form
236 the groups.

237

238 **Locale of the Study**

239 This study was conducted in Digos City National High School – Igpit HS Annex, Igpit, Digos City,
240 Davao del Sur, Philippines. Two sections of Grade 9 in this school were involved in this study.

241

242 **Respondents of the Study**

243 Eight students from one section were selected for remediation using the Grade 9 learner’s
244 material (control group) and another eight students from the other section for remediation
245 using the strategic intervention material developed by the researcher (experimental group).
246 These students from both sections were those who got lowest scores in the quarterly
247 examination.

248

249 **Research Instruments**

250 This study used a researcher-made 20-item pretest and posttest on solving problems involving
251 quadratic function. The questions were based from the pre-assessment of the Grade 9 based on
252 the Mathematics 9 Learner’s Material which was modified for the purpose of this study. The
253 test was administered to the control and experimental groups before and after the topic was
254 discussed by the teacher.

255

256

257

258

259 **Table 1: Comparative Matrix on Using SIM and DepEd’s Grade 9 Learner’s Material in**
 260 **Mathematics as Remediation Tool in Solving Problems Involving Quadratic Functions**

Factors	Experimental Group	Control Group
Teacher	Teacher-researcher	Teacher-researcher
Number of Students remediated	8	8
Subject competency	Mathematics 9	Mathematics 9
Teaching remediation tool as intervention	SIM	Grade 9 Learner’s Material

261
 262 SIM is a remediation tool that is developed with five (5) parts. These are Guide card, Activity
 263 card, Assessment card, Enrichment card and Reference card. On the other hand, the Grade 9
 264 Learner’s Material is composed of What to Know, What to Process, What to Reflect on and
 265 Further Understand and What to Transfer.

266
 267
 268 **RESULTS**

269
 270 **Academic Achievement of Students under Remediation**

271
 272 Table 1 shows that the pretest results of both groups under remediation are generally
 273 comparable. Based on the achievement descriptions set by the Department of Education, both
 274 the control group and the experimental group did not meet expectations. However, their
 275 respective standard deviations indicated that the pretest scores of the students in the control
 276 group were more scattered compared with that of the experimental group. The frequency and
 277 percentage of pretest scores show that before the conduct of the study, the participants in
 278 both the control group and the experimental group least mastered the concepts behind
 279 quadratic functions. Pretest results indicate the students have poor academic achievement
 280 scores. The results suggest for interventions that will aid the improvement of the students’
 281 academic achievement. It can be implied that when teachers may not incorporate effective
 282 interventions in the remediation class, students’ academic achievement would be on the same
 283 level, which is low.

284
 285 The results indicate that Grade 9 students under remediation struggle with their understanding;
 286 prerequisite and fundamental knowledge and/or skills have not been acquired or developed
 287 adequately to aid understanding. A similar finding in the pretest scores was revealed in a study
 288 conducted by **Barredo (2013)** that both groups of research subjects had the same level of
 289 mastery before an intervention was introduced to the experimental group and traditional
 290 instructional material to the control group.

291
 292
 293
 294
 295

Table 2: Achievement Scores of Students in Mathematics

Level of Proficiency	Range of Scores	Control Group				Experimental			
		Pretest		Posttest		Pretest		Posttest	
		f	%	f	%	f	%	f	%
Outstanding	17–20	0	0%	0	0%	0	0%	1	12.5%
Very Satisfactory	16	0	0%	0	0%	0	0%	1	12.5%
Satisfactory	14–15	0	0%	0	0%	0	0%	3	37.5%
Fairly Satisfactory	12–13	0	0%	0	0%	0	0%	2	25.0%
Did Not Meet Expectations	0–11	8	100%	8	100%	8	100%	1	12.5%
\bar{x}		3.50		9.00		3.25		13.88	
SD		2.00		1.69		1.49		2.70	

298

299 On the other hand, the posttest results of both groups showed that the experimental group had
 300 the greater posttest mean score compared with that of the control group. Based on the
 301 achievement descriptions set by the Department of Education, the experimental group met the
 302 “satisfactory” rating while the control group still obtained a “did not meet expectations” rating.
 303 Furthermore, results presented using frequencies and percentages show that in the posttest
 304 results of the two groups, a greater number of percentages of the students in the experimental
 305 group reached at least Fairly Satisfactory rate while none of the students in the control reached
 306 the same level. All students in the control group still did not meet the prescribed expectations
 307 while only little number of students in the experimental group remained at the same level.
 308 Findings suggest that students in the control group had not increased their scores compared to
 309 the students in the experimental group who had had an increased in their scores.

310

311 Results indicate that the use of SIM in remediating solving problems involving quadratic
 312 functions increases the students’ achievement significantly higher than the use of Grade 9 Math
 313 Learner’s Materials. SIM influence the students under remediation in the experimental group to
 314 perform better as compared to Grade 9 Math Learner’s Material. The results are in consonance
 315 with the findings of the study conducted by [Lusica \(2015\)](#) and [Barredo \(2013\)](#) that more
 316 learning has been taking place during the conduct of the study and that although there was a
 317 positive transfer of learning in the two groups, a higher mean was observed from the
 318 experimental group after the use of SIM as remediation tool.

319

320 Comparison of the Academic Achievement between Groups

321 Table 3 shows that there is a statistically significant difference in the academic achievement
 322 between the experimental group and the control group, in favor of the experimental group. The
 323 difference must have resulted from the use of SIM. The data show that the remediation tool
 324 obtained a p-value which is lower than the significance level of 0.05; thus, the null hypothesis
 325 which states that there is no significant difference in the academic achievement in Mathematics
 326 between the groups is rejected. The use of SIM gave a significant improvement in students’
 327 academic achievement than the use of Grade 9 Math Learner’s Material.

328

329 The findings are parallel to the earlier results of the researchers conducted by **Diaz and Dio**
330 **(2017)** who found out that the Tri-in-1 SIM is more effective in teaching right triangles than
331 using the Mathematics Learner's Material 9.

332
333 **Table 3: One-way ANCOVA Comparing the Results of Students' Achievement**
334

Source	Type III Sum of Squares	df	Mean Square	F	Sig.

335 R squared = 0.708 (Adjusted R squared = 0.663)
336
337

338 **DISCUSSION**

339 Pretest and posttest results of both groups presented in frequency and percentage
340 distributions and the analysis of covariance showed that Grade 9 students under remediation in
341 the experimental group had a better achievement than those in the control group.

342
343 With this, it can be inferred that there is a concrete manifestation of the Gestalt Theory
344 wherein students learn best when they can build on past experience, relate what they are
345 learning to things that are relevant to them, have direct "hands-on" experience, construct their
346 own knowledge in collaboration with other students and communicate their results effectively
347 **(Lewin, 1951)**. The same is true as the researcher's findings agreed with the findings of
348 **Gultiano (2012)**, who found out that intervention materials contributed to better learning of
349 the concepts among students wherein students manifested better retention of concepts
350 learned and that students who used the SIM are more superior in applying the knowledge in
351 problem solving exercises.

352
353 This result agrees with the findings of **Soriano (2012)** and **Tabago (2012)**, who found out that
354 intervention materials contributed to better learning of the concepts among students resulting
355 to better academic performance.

356
357 This finding however contradicts those of **Bassey (2012)**, who reported that students taught
358 with the conventional instructional materials had the highest achievement. The same
359 contradiction is also found in the findings of the study of **Barlis & Fajardo III (2013)** that resulted
360 to no significant difference in the mean gain scores of students who had a traditional method of
361 instructions and students who had been given an intervention material.
362

363 The significant differences in favor of the experimental group might have been due to the
364 nature of the instructional materials used by the experimental group (Estacio, 2008). In the
365 theory of Gamut (2014), he explained that instructional materials which do not fit in the
366 learning levels of the students might be useless in developing skills. Hence, it is essential that
367 teachers must use an effective and validated instructional materials and are according to the
368 learning levels of the students so that it can improve students' academic performance.

369
370 This implies that using SIM as remediation tool brings large effect on students' performance in
371 mathematics. Further, these point out that those students who are exposed to this intervention
372 material have a greater chance of increasing or improving their performance in mathematics.
373 The same approves the claim of Marimla & Dimalanta (2015) and Soberano (2009) in their
374 studies using instructional materials that resulted to a significant increase in the posttest mean
375 scores as compared from the pretest mean scores of the experimental group after employing
376 an intervening instructional materials as remediation tool.

377 378 **CONCLUSIONS**

379 Strategic Intervention Material can help improve the academic achievement of Grade 9
380 students in Mathematics. Incorporating SIM to the delivery of the lessons with least mastery
381 developed the mathematical skills in solving problems involving quadratic functions. The said
382 intervention material assists students to develop the fundamental knowledge, skills, and
383 understanding in Mathematics and aid them in the transfer of learning.

384 385 **RECOMMENDATIONS**

386 In the light of the foregoing findings and conclusions of the study, the following are
387 recommended:

388
389 Department of Education officials may institutionalize the use of SIM in reinforcing difficulties
390 of learners in learning Mathematics least learned competencies. They may formulate policies
391 that will encourage teachers to develop SIMs for their classes to maximize teachers' potential in
392 making more effective instructional materials which can be helpful in saving students who are
393 academically at-risk.

394
395 Principals, head teachers and master teachers can conduct seminars and in-service trainings
396 regarding the development of SIM that may aim to enhance and maximize teachers' potential
397 on developing instructional materials such as SIM as well as its implementation as a
398 remediation tool.

399
400 Mathematics teachers may develop SIMs for lessons to complete the least learned
401 competencies in all secondary level which can be as a remediation tool.

402
403 Researchers may embark similar studies on the use of SIM in Mathematics that are highly
404 needed to provide further evidence on the effectiveness of the SIM as a remediation tool.
405 These studies can also be extended to investigate the use of SIM as a tool for classroom-based
406 instruction.
