Editorial comments for manuscript entitled:

Study of effect of cowpea biscuits supplementation on nutritional and cognitive development of malnourished pre-school children

Abstract:

(1) Line 17; "however differences tended to be in expected direction".

Question:

Which direction? Was the direction of the result of the experiment pre-determined? This implies the authors had known the direction of the result of the experiment even before commencement of the work.

Please reframe this statement.

(2) In the method section, the authors only mentioned weight and height as the only anthropometric parameters measured. In the abstract, results and discussion sections, results for MUAC were provided. Therefore a brief mention of how MUAC was measured in the method section is required.

Section 3.4:

The different grades of malnutrition (Grade I, II & III) as mentioned by the authors should be briefly defined for clarity. This can be done below table 4.
